Everett, WA 98201

## FOREWARD

The Design and Construction Standards and Specifications for Development are prepared by the Public Works Department of the City of Everett in accordance with Ordinance 898-82. This document is intended to be used in conjunction with the current WSDOT Standard Specifications for Road, Bridge and Municipal Construction and current city policies and procedures.

This edition and updates apply whenever any public or private work is performed within the street rights of way or public easements of the City of Everett including work performed by private parties at their own expense under authority granted by ordinance of the City Council or permit process of the Public Works Department.

A document such as this is constantly being updated due to new technology, environmental considerations, federal and state regulatory requirements, changes in policy or procedures and methods of design and construction. Updates to this manual will be posted to the City web page ([www.everettwa.org](http://www.everettwa.org)) as they are approved and the version posted on the City Web Site shall be considered the most current for Public Works and private development.

Paper copies of this document may be obtained at the address below for \$25.00 per copy.

City of Everett  
Public Works Department  
3200 Cedar Street  
Everett, Washington 98201  
(425) 257-8800

Sincerely,

Ryan L. Sass, P.E.  
City Engineer

## SECTION 1 - GENERAL CONSIDERATIONS

### 1-1 STANDARDS

These City of Everett Design and Construction Standards and Specifications, hereinafter referred to as the “Standards”, shall apply whenever any public or private work is performed within the street rights-of-way in the City of Everett, including work performed by private parties at their own expense under authority granted by ordinance of the City Council permit process. Except where these Standards provide otherwise, design, construction and materials shall conform to the appropriate standards of the current edition of the following publications produced separately by the Washington State Department of Transportation (WSDOT) or jointly by WSDOT and the Washington State Chapter of the American Public Workers Association (APWA).

- A. WSDOT/APWA Standard Specifications for Road, Bridge and Municipal Construction, hereinafter referred to as the “WSDOT/APWA Standard Specifications”.
- B. WSDOT/APWA Standard Plans for Road, Bridge and Municipal Construction, hereinafter referred to as “WSDOT/APWA Standard Plans”.

### 1-2 REFERENCES

These Standards are intended to be consistent with the most currently adopted provisions of the following:

- A. Everett Municipal Codes
- B. City of Everett Surface Water Comprehensive Plan
- C. City of Everett Stormwater Management Manual
- D. State of Washington Shoreline Management Act
- E. State and National Environmental Policy Acts
- F. City Design Standards – Washington State
- G. International Building Code
- H. International Residential Code
- I. National Electrical Code
- J. Uniform Plumbing Code
- K. International Mechanical Code
- L. AWWA Standards
- M. WSDOT Design Manual
- N. WSDOT Traffic Manual
- O. WSDOT Utilities Manual
- P. WSDOT Construction Manual
- Q. A Policy on Geometric Design of Highways and Streets (AASHTO)
- R. Manual on Uniform Traffic Control Devices (MUTCD)
- S. AASHTO Guide for Design of Pavement Structures
- T. AASHTO LRFD Bridge Design Specifications

### **1-3 AS-BUILT DRAWINGS**

Prior to the acceptance of the work, the developer/contractor shall furnish the City Engineer one neatly and legibly marked set of the city approved, wet stamped plotter paper drawings of significant permanent items showing any and all changes in the final locations of all items of work including, but not limited to, curb and gutter, storm drain lines, water lines, sewer lines, catch basins, manholes, fire hydrants, valves, new and existing utilities and all other miscellaneous items included in the work. Marking of the drawings shall represent all changes, vertical and horizontal, and be done at the time the material and equipment is installed.

The city would prefer a computer file of the as-builts submitted in conjunction with the paper copy. The computer file should be capable of being imported to AutoCAD. Please refer to Section 1-10.1 of these Standards for information on plan format.

As-built drawings shall be required whether for private or public construction in accordance with the following:

#### Private Development

- A. Plats – Final plat approval shall be withheld until after the as-builts have been submitted and approved.
- B. Commercial – Final approval and installation of water meters will be withheld until the as-builts have been submitted and approved.

#### Public Construction

As-built drawings shall be considered an item on the contractor's punch list. Until all items on the punch list are completed, the project will not be sent to the City Council for approval. Final acceptance will be withheld until the as-built drawings are submitted and approved.

### **1-4 CITY PERFORMED WORK**

When work is to be performed by the city, the city will provide all the material required for the said work. The cost for the material and the work performed shall be at the developer's expense. Any requests for city work should be scheduled at least one week in advance.

### **1-5 CONTROL OF NOISE**

The city shall establish regulations for control of noise in residentially zoned property. For the purpose of regulating potentially disruptive or annoying noise, Ordinance No. 1556-89 states that all residentially zoned lands fall within Noise Control District No. 1.

Under the City's Noise Ordinance, construction related noise has limitations during the hours before 7 a.m. and after 10 p.m. on weekdays and before 8 a.m. and after 6 p.m. on weekends and state recognized holidays. Due to citizen concerns about construction noise in neighborhoods, and given the city's intent to limit the occurrence of public disturbance noise, construction sites will be monitored and violators are subject to fines.

Construction contractors are responsible for notifying subcontractors of the city's noise regulations.

**1-6 GUARANTEES**

Performance and warranty guarantees will be required for all public works improvements, unless waived by the City Engineer. Work to be performed by any state agency or unit of local government shall be exempt from providing guarantees based on Chapter 35A.21.250 R.C.W.

Acceptable methods of guarantees will be as follows:

- A. Bond
- B. Assignment of Funds (Performance)
- C. Set-aside Letter (Warranty)
- D. Cash Deposit

Standard documents as approved by the city for the above items are available from the Public Works Department.

**1-6.1 PERFORMANCE**

Performance guarantees will be required for all improvements located in the public rights-of-way and as required by city ordinance as detailed on the approved plans and as noted in the follow summary:

<u>Street/Alley</u>	<u>Drainage (private)</u>	<u>Utilities (public)</u>
Estimated cost plus 20%; construct improvements prior to building permit issuance; for a plat construct all improvements prior to final plat approval.	For properties with drainage abatements facilities, estimated cost plus 20%.	Estimated cost plus 20%; construct improvements prior to occupancy; for a plat construct prior to final plat approval.

The initial guarantee and subsequent extensions as approved will be limited to one year increments. If time extensions are approved, the guarantee amount shall be revised to reflect inflation and/or other cost impacts.

The developer shall provide an estimate, prepared by a licensed engineer, of the improvements based on the approved plans. The estimate shall be itemized by description, quantities and costs. The submitted data will be reviewed by public works for adequacy of quantities and comprehensiveness of estimates. The estimate shall be reviewed to reflect the city's cost to complete the improvements.

**1-6.2 WARRANTY**

Warranty guarantees will be required at the time of final acceptance of the public improvements and/or improvements required by city ordinance. The guarantee amount will be 10% of the documented final cost of the improvements. The warranty guarantee is required prior to release of the performance guarantee. Methods of posting warranty guarantee shall be the same as for performance guarantee and shall be for the lengths of time as listed below:

<u>Street/Alley</u>	<u>Drainage (private)</u>	<u>Utilities (public)</u>
One Year	Two Years (will be extended for 1 year if city elects to assume maintenance.)	One Year

## 1-7 PERMITS

A public works permit is required for all work within the public right-of-way and city utility easements, and for all sewer, water, and drainage improvements, including fill and excavation, parking lot construction and/or paving on private property.

The approved applicant's copy of the public works permit, together with a set of plans approved by the Public Works Department shall be available on the job site whenever work is being done on any portion of the project.

Any questions regarding information about permits and the approved prices should be directed to the building counter located on the second floor of the Service Center Building at 3200 Cedar Street in Everett.

## 1-8 LEGAL RELATIONS AND RESPONSIBILITIES

The contractor at all times shall comply with all Federal and State laws, local laws and ordinances, and any regulations which in any manner affect the project.

The contractor shall release, indemnify and promise to defend and save harmless the city, its officers, employees and agents from and against any and all liability, loss, damage, and expense, actions and claims, including costs and reasonable attorneys' fees incurred by the city in defense thereof, asserting or arising directly or indirectly on account of any violation of laws, ordinances or regulations whether such violations are by the contractor, his subcontractors, his employees, or his agents.

## 1-9 MODIFICATIONS OF STANDARDS

Modifications from these Standards may be granted by the City Engineer upon evidence that such modifications are in the public interest, that they are based upon sound engineering judgment, and that requirements for safety, function, appearance, environment, and maintainability are fully met. Desired modifications must be approved prior to construction.

## 1-10 PLAN REVIEW

The Public Works Department has established basic standards for improvement plans so plan checking can be processed efficiently. See each section for specific requirements over and above the following standards. Plans must meet these standards before they will be accepted. Requirements for plans will be divided into two general categories.

- A. Minor Projects: Work not requiring public right-of-way improvements. For example, small site projects such as a new house or duplex, garage addition, house addition or remodel.
- B. Major Projects: Work involving street improvements, drainage, water and sewer improvements. Plan for major projects must be drawn by a registered civil engineer licensed in the State of Washington.

**1-10.1 FORMAT AND REQUIRED DATA**

- A. All public works plans for street improvements and utility systems shall be prepared in a plan/profile format either with sheets printed in half plan and half profile or with separate sheets for plan view and profile views.
- B. In addition to paper plan and profile sheets, it is required that all plans for major projects should be submitted with a computer file that can be imported to AutoCAD. Major projects are as defined in Section 1-10 A above or as otherwise identified by the City Engineer. Copies of the city specified format for AutoCAD are available at the building counter located on the second floor of the Public Works Service Center at 3200 Cedar Street, Everett, Washington.
- C. Plans shall be prepared with all utilities, both new and existing, shown on all sets of plans. For example, on the sanitary sewer sets, the water and storm drains shall be shown with the sanitary sewer portions being heavily highlighted. Other utilities are also to be shown in profile views where crossings occur.
- D. Whenever possible, use notes specifying city standard numbers for common items such as catch basins, restrictors, fire hydrant assemblies, etc.
- E. Show the existing channelization of all streets that front the proposed development. Show all curb cuts on both the adjacent properties and the properties across the street that front on the proposed development.
- F. Show complete data for curb radii, utility locations (new and existing), curb elevations, street stationing, street widths, existing adjacent improvements, elevations of existing street improvements, and utilities, etc.
- G. All elevations and grades on public works plans shall be to the 1988 N.A.V.D. (North American Vertical Datum).
- H. A "Driveway Schedule" which lists all of the driveways, both residential and commercial, being constructed and shall include the following information pertaining to each driveway, in tabular form:
  - 1. Location of driveway
  - 2. Surface type
  - 3. Width
  - 4. Profile grade (may require separate sketch)
  - 5. Length
- J. Plans shall show any environmental features such as wetlands, streams, steep slopes and any associated buffers for each.

## 1-10.2 REQUIRED DRAWINGS

The following plans for public works improvements and utilities shall be prepared:

- A. Erosion Control & Grading Plan
- B. Grading Plan
- C. Storm Drain or Drainage Plan (Drainage & Street Plans may be combined together).
- D. Water System Plan
- E. Sanitary Sewer Plan
- F. Street Improvements\*
- G. Landscaping Plan

\* A separate cross section plan sheet is required for all new street construction. Distance between stations shall be determined by City Engineer based on site topography.

For many minor projects, some or all the above required sheets may be condensed into one plan sheet. If an extension or either a sewer main, water main, or storm drain main is required, a separate sheet will be required for that work.

## 1-10.3 SCALE OF DRAWINGS

All plans are to be drawn utilizing an engineer's scale.

The acceptable scale for public works improvement plans shall be 1"=40' or larger for plan view (horizontal) and 1"=5' for profile view (vertical). A larger scale such as 1"=20' for the plan view may be used on smaller projects when greater clarity can be attained.

## 1-10.4 SIZE OF DRAWINGS

- A. Minor Projects: Plans must be drawn or printed on paper that is relatively heavy, such as blueprint quality or standard drafting paper. Plans drawn on tissue paper, poster board or cardboard will not be accepted. Preferred sizes are 11"x17" and 22"x34". The minimum acceptable size is to be 8-1/2"x11", with the maximum acceptable size being 24"x36".
- B. Major Projects: Plans must be plotted on 20# bond or other appropriate drafting paper. Preferred size is 22"x34". Plans shall be no less than 22"x34" and no larger than 24"x36".

## 1-11 PROTECTION OF PROPERTY AND UTILITIES

### 1-11.1 PROPERTY

The contractor shall protect and preserve from damage, interference and destruction all private and public property on or in the vicinity of the work. If such property is damaged or destroyed or its use interfered with by the contractor or his agents, it shall be restored immediately to its former condition by the contractor at his expense and such interference terminated.

### 1-11.2 UTILITIES

The contractor shall protect from damage private and public utilities, including telephone and telegraph lines, power lines, sewer and water lines, railroad tracks and appurtenances, highway lighting and signal systems, and similar facilities. Before beginning excavation, the contractor shall provide notice of commencement to all owners of underground facilities through the one number locator service, phone

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

number 1-800-424-5555, if available; if not he shall give notice to all individual utility owners. Such notice shall not be less than 2 nor more than 10 business days before the scheduled date of excavation.

### **1-12 SITE MAINTENANCE**

The developer and contractor shall schedule and control his work so as to prevent all hazards to public safety, health and welfare.

Streets shall be kept free of dirt and debris on a continuous basis.

Pedestrian facilities shall be kept free of obstruction, and an accessible route shall be maintained at all times.

On existing street, two way traffic shall be maintained at all times unless detour plans have been approved in advance by the City Traffic Engineer.

Pedestrian and vehicular access to occupied buildings shall be maintained at all times except where approval from the building owner has been obtained.

Adherence to the project's erosion and sediment control plan will be required. Features contained therein, such as silt fences, check dams and sedimentation ponds shall be maintained in good working order to the satisfaction of the public works inspector.

### **1-13 TRAFFIC CONTROL**

#### **1-13.1 GENERAL**

Traffic control for all projects shall comply with Chapter 6 of MUTCD. The contractor shall be responsible to furnish and maintain all required labor and materials as needed to the satisfaction of the City Engineer.

The contractor shall conduct his operations as to offer the least possible obstruction and inconvenience to the public, and he shall have under construction no greater length or amount of work than he can prosecute properly with regard to the rights of the public. He shall not open up sections of the work and leave them unfinished, but he shall finish the work as he goes insofar as practicable.

Unless otherwise approved in writing by the City Engineer, all public traffic shall be permitted to pass through the work with as little inconvenience and delay as possible. The contractor shall keep existing roads and streets adjacent to or within the limits of the project open to and maintained in a good and safe condition for traffic at all times. The contractor shall remove any deposits or debris and shall repair any damage resulting from his operations. Construction shall be conducted so as to cause as little inconvenience as possible to abutting property owners. Convenient access to driveways, houses and buildings along the line of work shall be maintained.

Construction signs shall not be placed on sidewalks or pedestrian pathways impeding wheelchair or pedestrian traffic. If the work entails removing panels of sidewalk, then place sidewalk closed signs in advance of the work area and provide accessible pedestrian detour route. This will allow the handicapped and pedestrians to utilize an alternate route.

If the road construction activities require advanced warning signs, then signs will be placed in accordance with the MUTCD manual and WORK ZONE TRAFFIC CONTROL book.

Signs and traffic control devices should not be a hazard to pedestrians. Signs located near or adjacent to sidewalk should have a 7-foot clearance. In the event that sidewalks on both sides of the project are closed, then pedestrians should be guided around the construction site.

If your signing crews are in doubt, have them contact the appropriate City of Everett Inspectors.

### **1-13.2 DETOURS AND ROAD CLOSURES**

Approval must be received from the city traffic engineer for all detours and road closures. A formal traffic control plan complying with the MUTCD shall be submitted to public works for review and approval by the traffic engineer prior to any work proceeding.

### **1-13.3 FLAGGERS, BARRICADES AND SIGNS**

Flagger(s), barricades, signs shall conform to the Standards established in the latest edition of the “Manual on Uniform Traffic Control Devices” (MUTCD). Standard Plan No’s 701A through 701L show typical traffic control conditions. Standard Plan No. 702 shows typical traffic control devices. Should the contractor deviate from these Standard Plans, he or she should prepare a signing plan showing the necessary construction signing, barricades and flagger(s) required for the project and submit the plan(s) to the public works for approval by the City Engineer in advance of the time the signing and barricades will be required. All equipment and materials required for traffic control shall be furnished, installed and maintained by the contractor to the satisfaction of the City Engineer.

During construction activity at signalized locations, an off-duty, uniformed police officer shall be required at all times the signal or beacon is turned off or when the traffic signal indicator is countermanded, or if the engineer determines it is necessary for traffic control. Officers are also required for new traffic signal work.

The uniformed police officer shall be provided by the contractor. For information on police officer availability, call the City of Everett Police Department at 259-0400.

### **1-13.4 PLACEMENT OF CONSTRUCTION SIGNS ON SIDEWALKS AND PEDESTRIAN PATHWAYS**

Construction signs shall not be placed on sidewalks or pedestrian pathways impeding wheelchair or pedestrian traffic. If the work entails removing panels or sidewalk, then place sidewalk closed signs in advance of the work area and provide an alternate accessible route. This will allow the handicapped and pedestrians to utilize an alternate route.

If the road construction activities require advanced warning signs, then signs will be placed in accordance with the MUTCD manual and WORK ZONE TRAFFIC CONTROL book.

Signs and traffic control devices should not be a hazard to pedestrians. Signs located near or adjacent to sidewalk should have a 7-foot clearance. In the event that sidewalks on both sides of the project are closed, then pedestrians should be guided around the construction site.

If your signing crews are in doubt, have them contact the appropriate City of Everett inspectors.

## **1-14 CONTROL AND INSPECTION**

### **1-14.1 GENERAL**

Work performed in construction or improvements within the city, whether by a private developer, a city contractor or city forces, shall be done in accordance with the approved plans and specifications and to the satisfaction of the City Engineer.

No work may be started until such plans are approved. Any revision to such plans shall be approved by the City Engineer prior to performance of the work.

The City Engineer will have authority to enforce these Standards as well as other referenced or pertinent specifications and will appoint project engineers, assistances and inspectors as necessary to inspect the work for compliance.

### **1-14.2 MATERIALS SAMPLING & TESTING**

#### **1-14.2(1) DEVELOPMENTS**

It shall be the responsibility of the developer to provide test reports certified by a professional engineer licensed in the State of Washington to verify compliance of materials used in the project. Sampling and/or testing shall be at a frequency and magnitude determined by the City Engineer or designated representative. Copies of all test reports shall be furnished to the City Engineer. All costs incurred for testing or sampling, as required, shall be the responsibility of the developer.

#### **1-14.2(2) CITY FORCES & CITY CONTRACTORS**

Construction work performed by city forces and city contractors shall be inspected by city inspectors. Sampling and testing shall be performed by city inspectors or by a professional laboratory.

#### **1-14.2(3) NOTIFICATION OF INSPECTION**

The developer shall notify the city of inspection needs in a timely manner. In general, a minimum of 24 hours advance notice will be required. Failure to notify in time may oblige the city to arrange appropriate sampling and testing after-the-fact, with certification by a qualified private testing laboratory. Costs of such testing and certification shall be borne by the developer.

## **1-15 ASBESTOS CONTROL**

Asbestos containing material (ACM) may be encountered during a construction project in the form of asbestos cement pipe, pipe insulation, or as insulation in a structure that is being demolished. It can be found in pipe for water and sewer mains, electrical conduits, drainage pipe, and vent pipes, etc. Normal breakage and crushing of the material can cause an asbestos fiber release which presents a serious respiratory hazard. It is imperative that asbestos fiber release be controlled. Citations, by regulatory agencies, for an asbestos fiber release carry substantial fines.

Only employees certified by the State of Washington as a Certified Asbestos Worker may work on ACM during construction, demolition, repair, maintenance, renovation, salvage, or disposal of ACM.

The contractor shall have all asbestos removed from the site and property disposed of by a State licensed asbestos contractor in accordance with the practices specified by the State of Washington Department of

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Ecology, the Snohomish County Solid Waste Division and all other pertinent State and Federal Regulations. See WAC 296-62-077.

### **1-16 LANDSCAPING**

The development of landscaping and erosion control is to conform to the basic concepts and principles set forth in the City of Everett Zoning Code. Landscaping shall be required on all projects to provide visual orientation for traffic safety; to create physical delineation of parking areas and to furnish definition and scale of the entire complex by interval plantings and to ensure the preservation of land values by creating an environmental quality which complements the objectives of the respective land uses in any zone. A copy of the Zoning Code is available for review at the building counter, second floor of the Service Center located at 3200 Cedar Street in Everett.

## SECTION 2 - EROSION AND SEDIMENT CONTROL

### 2-1 GENERAL

All projects and land disturbing activities are required to prevent erosion and control sediment leaving the site. Every effort must be made to prevent sediment from entering the storm drainage system and surface waters, and air quality must be preserved. Erosion and sediment control requirements are given the Stormwater Management Manual and must be followed for all land disturbing activities except as listed in Section 2-1.1.

Land disturbing activities are those activities which are commonly referred to as clearing (the act of vegetation removal from the land surface, often referred to as land clearing); grubbing (the act of root vegetation removal from beneath the surface of the earth, usually in conjunction with clearing); excavation (the mechanical removal of earth material); filling (deposition of earth material placed by artificial means); grading (excavation of filling or combination thereof); and stockpiling (temporary deposition of earth material placed by artificial means).

#### 2-1.1 EXCEPTIONS AND ALTERNATE STANDARDS

Certain project types and land disturbing activities are not subject to the above requirements and are instead regulated by alternate erosion and sedimentation control standards. The following activities are not subject to the requirements of this section, but are instead regulated in the manner noted:

- **Forest Practices**

Comply with DNR Forest Practice Standards for Erosion Control

- **Commercial Agricultural**

Agricultural activities are exempt from this requirement. However, construction of new hard surfaces including paving and constructing structures or land disturbing activities not associated with regular agricultural activities are not exempt.

- **Activities which are part of regular operations permitted under an individual NPDES permit or a separate General Permit issued by the Washington Department of Ecology.**

Activities are regulated by the requirements of the applicable NPDES permit and the associated SWPPP.

- **The activity is covered under the WSDOT Stormwater General Permit and is designed in accordance with the WSDOT Temporary Erosion and Sediment Control Manual, provided that any more restrictive City of Everett requirements are met.**

WSDOT Erosions Control Standards and Erosion and Sedimentation Control plan requirements are applied.

- **Activities initiated by the City or its contractors which are associated with road maintenance as defined in Section 2.2 of Volume I of the Stormwater Management Manual**

Road Maintenance Projects shall implement BMPs in accordance with the Regional Road Maintenance Program requirements

## 2-2 CONSTRUCTION SURFACE WATER POLLUTION PREVENTION PLAN

All new development and redevelopment projects are responsible for preventing erosion and sedimentation during construction. Projects which disturb more than 2000 SF of soil shall prepare a Construction Stormwater Pollution Prevention Plan (SWPPP) prior to beginning construction activities. The CSWPPP shall be prepared in accordance with Volume II of the Stormwater Management Manual. The level of detail required in a CSWPPP is dependent upon the size of the project.

- **Projects which add less than 2000 SF of new plus replaced impervious surface AND disturb less than 7,000 sf of land:**

A SWPPP is not required, but the project must document compliance with the 13 Elements listed in Section 2-2.2 that pertain to the project.

- **Projects which add more than 2000 SF of new plus replaced impervious surface OR disturb more than 7,000 SF of land, but disturb less than 1 Acre of Land:**

Prepare a SWPPP in accordance with Minimum Requirement #2 of the Stormwater Management Manual. Smaller Projects may be able to prepare a simplified SWPPP. Contact Permit Services to determine if a simplified SWPPP is appropriate and to determine requirements.

- **Projects which disturb more than 1 acre of land or which constitute a high erosion risk as determined by the City or the Washington State Department of Ecology:**

The project shall apply for coverage under Washington's Construction Stormwater General Permit. The project SWPPP shall be prepared in accordance

### 2-2.1 SWPPP IMPLEMENTATION AND MAINTENANCE

The approved project CSWPPP shall be included as part of the construction documents and shall be retained on site or readily available to the contractor throughout the duration of the construction project.

The CSWPPP is a living document and should be updated throughout the course of construction. The project Certified Erosion and Sediment Control Lead (CESCL) or qualified project representative should inspect the site and all BMPs on a regular basis to verify their continued function and effectiveness. If, during the course of construction, the approved BMP's are found to be inadequate to control erosion or sediment transport from the site the BMP's shall be changed or additional BMPs added to address the inadequacies. Changes to the BMPs being used on the site should be noted in the CSWPPP. Refer to the requirements for Element #12 in Volume 2 of the Stormwater Management Manual for additional requirements for inspection and documentation

The updated CSWPPP, including records of inspections and changes to the BMPs shall be available for review by the City's inspector upon request.

## **2-3 ELEMENTS OF EROSION AND SEDIMENT CONTROL**

Minimum Requirement #2 of the Stormwater Management Manual Establishes 13 Elements of construction pollution prevention which must be addressed by each construction project. Development projects must address each of these elements in the design and documentation of the project. For those elements which are not applicable to a project justification must be provided demonstrating why the element is not applicable. Refer to the Stormwater Management Manual for detailed explanations of each of these elements.

1. Preserve Vegetation / Mark Clearing Limits
2. Establish Construction Access
3. Control Flow Rates
4. Install Sediment Controls
5. Stabilize Soils
6. Protect Slopes
7. Protect Drain Inlets
8. Stabilize Channels and Outfalls
9. Control Pollutants
10. Control Dewatering
11. Maintain BMPs
12. Manage the Project
13. Protect Low Impact Development

## **2-4 EROSION AND SEDIMENT CONTROL BMPs**

Erosion and Sediment Control Best Management Practices (BMPs) shall be designed and implemented in accordance with Chapter 4 of Volume II of the Stormwater Management Manual. BMPs shall be provided to address each of the 13 elements cited in Section 2-3.

### **2-4.1 EMERGING TECHNOLOGIES AND EQUIVALENT BMPs.**

Proprietary erosion and sediment control BMPs may be used in place of those listed in the Stormwater Management Manual if they have received prior approval for use by the City or by the Washington Department of Ecology (Ecology). Ecology has two methods for approving proprietary BMPs, review through the TAPE program and BMPs which have been reviewed and deemed equivalent to BMPs listed in the Stormwater Management Manual.

BMPs which have been reviewed through the TAPE program are published on Ecology's website here: <http://www.ecy.wa.gov/programs/wq/stormwater/newtech/technologies.html> . The City will accept BMPs which have received a GULD designation. Products which have received PULD or CULD ratings may only be used with prior approval of the Director. Approved BMPs shall be implemented in accordance with the approval documentation and all other applicable requirements.

Equivalent BMPs are published on Ecology's website at: <http://www.ecy.wa.gov/programs/wq/stormwater/newtech/equivalent.html>. Equivalent BMPs should be used in a manner consistent with the BMP for which they have been deemed equivalent.

### **2-4.2 SMALL PARCEL BMPs**

Many of the BMPs listed in the Stormwater Management Manual are not practical to implement on very small projects such as single home construction. These small projects should implement BMPs to address

all 13 Elements to the extent feasible. In addition, small projects should consider other methods of preventing erosion and controlling sediment, including the following BMPs:

**2-4.2(1) BMP ES.10 PLANNED CLEARING AND GRADING**

Clearing and grading of the site should be planned properly. It is important to clear only the areas needed, thus keeping exposed areas to a minimum. Clearing should be phased so that only those areas that are actively being worked are uncovered. Clearing limits should be flagged and reviewed by the appropriate city official in the lot or area prior to the initiation of clearing.

**2-4.2(2) BMP ES.20 EXCAVATED BASEMENT SOIL**

Excavated basement soil should be located a reasonable distance behind the curb, such as in the backyard or side yard area. This practice will increase the distance eroded soil must travel to reach the storm sewer system. Soil piles should be covered until the soil is either used or removed. Piles should be situated so that sediment does not erode into the street, adjoining yards and does not enter surface water.

**2-4.2(3) BMP ES.30 BACKFILLING**

Basement walls should be backfilled as soon as possible and the lot rough graded. This practice will eliminate large soil mounds which are highly erodible and prepares the lot for temporary cover, which will further reduce erosion potential.

**2-4.2(4) BMP ES.40 REMOVAL OF EXCESS SOIL**

Excess soil should be removed from the site as soon as possible after backfilling. This practice will minimize sediment loss from surplus fill.

**2-4.2(5) BMP ES.50 MANAGEMENT OF SOIL BANKS**

If a lot has a soil bank higher than the curb, the bank should be located several feet behind the curb and a shallow trench should be excavated between the bank and the curb. This practice will help prevent any eroded sediment from entering the street.

**2-4.2(6) BMP ES.80 STREET CLEANING**

Periodic street cleaning shall be provided to remove any sediment that may have been tracked out onto paved areas. Sediment should be removed by shoveling or sweeping and carefully removed to a suitable disposal area where it will not be re-eroded. The use of vacuum sweepers is encouraged. Additional street cleaning may be required as directed by the city public works inspector. Special care should be taken to reduce sediments from entering storm drains connected to salmon streams. The use of water to clean sediment from streets is not an acceptable alternative. Street cleaning should not be used as a substitute for implementing other BMPs which prevent erosion or contain sediments on the site.

**2-4.2(7) BMP ES.90 FLOW PATH REDUCTION**

Minimize the distance that water flows across exposed soils by carefully planning the placement of construction materials and planning of excavation and grading activities.

**2-5 STANDARD NOTES**

The following standard notes shall be added to construction plan sets and edited as appropriate to the project.

1. Approval of this erosion/sedimentation control (ESC) plan does not constitute an approval of permanent road or drainage design (e.g. size and location of roads, pipes, restrictors, channels, retention facilities, utilities).
2. The implementation of these ESC plans and the construction, maintenance, replacement, and upgrading of these ESC facilities is the responsibility of the applicant/contractor until all construction is completed and approved and vegetation/landscaping is established.
3. The boundaries of the clearing limits shown on this plan shall be clearly flagged in the field prior to construction. During the construction period, no disturbance beyond the flagged clearing limits shall be permitted. The flagging shall be maintained by the applicant/contractor for the duration of construction.
4. The ESC facilities shown on this plan must be constructed in conjunction with all clearing and grading activities, and in such a manner as to insure that sediment and sediment laden water do not enter the drainage system, roadways, or violate applicable water standards.
5. The ESC facilities shown on this plan are the minimum requirements for anticipated site conditions. During the construction period, these ESC facilities shall be upgraded as needed for unexpected storm events and to ensure that sediment and sediment-laden water do not leave the site.
6. The ESC facilities shall be inspected routinely by the applicant/contractor and maintained as necessary to ensure their continued functioning.
7. The ESC facilities on inactive sites shall be inspected and maintained a minimum of once a month or within the 48 hours following a major storm event.
8. At no time shall more than one foot of sediment be allowed to accumulate within a trapped catch basin. All catch basins and conveyance lines shall be cleaned prior to paving. The cleaning operation shall not flush sediment laden water into the downstream system.
9. Stabilized construction entrances shall be installed at the beginning of construction and maintained for the duration of the project. Additional measures may be required to ensure that all paved areas are kept clean for the duration of the project.

## **SECTION 3 - STREETS AND RELATED WORK**

### **3-1 GENERAL REQUIREMENTS**

All work performed in the design, preparation of plans and in the construction or improvement of city streets and all appurtenances, whether public or private shall be the responsibility of the developer or contractor and done to the satisfaction of the City Engineer and in accordance with the plans and specifications approved by the city for the work.

It is emphasized that no permits will be issued to start work until plans for that work are approved. Any revisions to the plans shall be approved by the City Engineer before being implemented. A set of “as-built” drawings (Mylars) will be required at the completion of the project and prior to final acceptance of the work. See individual utility sections for more specific “as-built” requirements.

City Ordinances and Standards establish policy for the installation of street improvements. Specific application will be determined at the time of permit application and/or issuance.

### **3-2 ROADWAY TYPES AND GEOMETRICS**

#### **3-2.1 GENERAL**

City of Everett roadways are classified functionally as indicated in Standard Plan No. 300. Criteria for minimum right-of-way and roadway widths and other geometrics shall be as listed for given classifications.

Structural sections and roadway appurtenances shall be as shown on Standard Plan Nos. 301 and 302. In certain cases permeable pavement may be required to meet stormwater criteria. See Section 4-4.3(4) for permeable pavement design standards.

The City Engineer may require the second lift asphalt to be bonded and delayed for up to one year.

Typical utility locations for design purposes are shown on Standard Plan No. 322.

#### **3-2.2 HORIZONTAL ALIGNMENT**

##### **3-2.2(1) CURB RETURN RADII**

For the intersection of two local streets, the minimum allowable curb radius shall be 25 feet, which is to be measured from the radius point to the face of curb.

For the intersection of a local street with any collector or arterial, the minimum radius shall be 30 feet.

##### **3-2.2(2) LOCAL STREETS**

For the intersection of two local streets, the minimum allowable curb radius shall be 25 feet, which is to be measured from the radius point to the face of curb.

For the intersection of a local street with any collector or arterial, the minimum radius shall be 30 feet.

##### **3-2.2(3) OTHER STREETS**

On all other street intersections, the minimum allowable radii shall be 30 feet.

### 3-2.2(4) TRUCKS AND BUSES

Radii of 40 feet or more should be provided where large truck combinations and buses turn frequently. Larger radii are also desirable where speed reductions would cause problems.

### 3-2.3 INTERSECTIONS

Angle of Intersection	80° to 90°
Minimum Centerline Radius	N/A
Minimum Curb Radius	25 feet

### 3-2.4 STREET ENDS

Cul-de-sacs shall be provided at all permanent street ends, and on any temporary dead end location when the length of the street is more than 150 feet in length. Cul-de-sacs shall be per Standard Plan No. 304.

On temporary dead ends, when the street is less than 200 feet in length, the required turnaround area may be a hammerhead type of design per Standard Plan No. 323.

### 3-3 EASEMENTS

A nonexclusive easement shall be reserved for and granted to all utilities serving subject plat and their respective successors and assigns, over, under and upon the exterior 10 feet parallel with adjoining the street frontage of all lots and common areas in which to install, lay, construct, renew, operate and maintain underground conduits, cables, pipes, and wires; together with other necessary facilities and equipment, for the purpose of serving this subdivision and other property with utility service, together with the right to enter upon the lots at all times for the purposes herein stated.

### 3-4 FIRE DEPARTMENT ACCESS

As required by the fire chief, every building constructed shall be accessible to the Fire Department, both during and after construction, by way of access roadways approved by the Fire Department. The roadway shall have at least 20 feet of unobstructed width, shall have adequate roadway turning radius, and be capable of supporting the imposed loads of fire apparatus. The minimum allowable vertical clearance shall be 13 feet 6 inches. All required fire access roads must be in service prior to commencement of construction.

When access roads cannot be installed due to topography, waterways, nonnegotiable grades or other similar conditions, the chief is authorized to require additional fire protection as specified in Section 10.501(b) of the Uniform Fire Code. Such devices or appliances may consist of automatic fire alarm systems, automatic sprinkler or water spray systems, standpipe and hose, fixed or portable fire extinguishers, suitable fire blankets, breathing apparatus, manual or automatic covers, carbon dioxide, foam, halogenated or dry chemical or other special fire-extinguishing systems. Where such systems are provided, they shall be designed and installed in accordance with the applicable Uniform Fire Code Standards.

The following definitions shall apply:

- A. **Fire Lane:** That portion of the Fire Department access to areas or structures which is required by the provisions of Chapter 46.44 of the Everett Municipal Code. Generally, this access is in larger complexes and constitute continuous loops around buildings or complexes.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

- B. **Fire Access Road:** That portion of the Fire Department access to areas or structures which is required by the provisions of Section 10.207 of the Uniform Fire Code, 1991 edition or subsequent revision. This type of access may be provided to almost any type of property.
- C. **Access Easement:** That portion of a “fire access road” as defined above which is provided by the granting of a permanent easement over one or more properties in order to provide permanent access to other projects.
- D. **Short Plat Access:** That portion of Fire Department access into short plats regulated by Title 18 of the Everett Municipal Code.

Temporary access roads in use during building construction shall be constructed for all weather driving conditions. At no time during the construction of the project should the roadway surface consist primarily of dirt, mud, sand, or other material that, in the opinion of the Fire Chief, may impair fire fighting or rescue operations. The required 20 foot width must be maintained so that the driving surface is recognizable day or night.

The required width of any fire apparatus access road shall not be obstructed in any manner, including parking of vehicles. Minimum required widths and clearances established under this section shall be maintained at all times. The required cul-de-sac turnaround for fire apparatus shall be per Standard Drawing No. 304.

### 3-5 PARKING LOTS

#### 3-5.1 GENERAL

Off street parking lots shall be constructed in conformance with the requirements for number of stalls and landscaping as noted in the Zoning Code. Additionally, if all of the following are met, a maximum of 15% of the required number of stalls may be sized for compact cars, as shown on Standard Plan Nos. 334A and 334B. Aisle widths may be required to be widened if multiple utility lines are located within the aisle corridor.

- A. The parking lot contains 20 or more parking spaces.
- B. The parking area is defined as long term parking, i.e., more than 3-4 hours and does not involve packages. For example, a shopping center could not meet this criterion, but an apartment complex could.
- C. The compact stalls are located together and are not intermixed with the standard parking stalls.

#### 3-5.2 CONSTRUCTION

All parking lot construction shall be inspected by the Public Works Department for conformance to plans for size, layout, drainage control and structural section. The minimum acceptable structural section for parking lots shall be 2 inches compacted depth HMA Class ½” PG 64-22 asphalt pavement placed over 4 inches of Crushed Surfacing Base Course, unless otherwise approved by the City Engineer. In certain cases permeable pavement may be required to meet stormwater criteria. See Section 4-4.3(4) for permeable pavement design standards. Prior to placing any surfacing material on the roadway, it will be the responsibility of the developer/contractor to provide density test reports certified by a professional engineer registered in the State of Washington.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Crushed Surfacing Base Course shall be compacted to 95% maximum density. Density testing for asphalt pavement including the necessity and frequency of core samples will be determined by the engineer on a case by case basis.

For construction of Low Impact Development (LID) facilities, construction sequencing shall minimize impacts to proposed LID facilities by reducing potential for soil erosion and compaction of areas where infiltration facilities are planned.

### **3-5.3 HANDICAP REQUIREMENTS**

Handicap parking stalls shall meet the requirements of Washington State Regulations for Barrier Free Facilities (WAC 51-30) and the Americans with Disabilities Act (ADA) as applicable.

Safe, convenient handicap access is required from the street to all buildings on site. This is in addition to safe, convenient handicap access between buildings. See Section 3-5.5.

### **3-5.4 ILLUMINATION**

Parking lot illumination shall be provided for all parking lots containing more than ten (10) parking spaces, and shall be designed and constructed so as to:

- A. Provide security lighting to all parking spaces.
- B. Provide using full-cutoff luminaires to minimize off site lighting impacts.
- C. Minimize illumination of salmonid bearing streams to minimize potential predation.

### **3-5.5 PEDESTRIAN CONCERNS**

Pedestrian walkways may be required within commercial parking lots as determined by city traffic engineer.

Internal vehicle and pedestrian circulation for parking lots shall be approved by the planning director and traffic engineer. Parking lot circulation shall allow for access so pedestrians and wheelchairs can easily gain access from public sidewalks and bus stops to building entrances through the use of pedestrian paths which are physically separated from vehicle traffic and maneuvering areas. In shopping center parking lots containing more than 100 spaces, such pedestrian/wheelchair paths shall be a minimum of 5 feet wide and constructed in a manner that they cannot be used as a holding area for shopping carts.

Access driveways for parking areas shall be located so as to cause the least possible conflict with vehicular and pedestrian traffic on public rights-of-way.

The traffic engineer may require joint use of driveways by more than one property.

**3-6 THROAT LENGTH REQUIREMENTS**

The throat length is the unobstructed storage length requirement measured from the inside face of curb to the first driveway or parking stall. Distances may be reduced for multiple driveways as approved by the City Engineer. Minimum throat lengths for each particular land use are as shown on the following table:

MINIMUM THROAT LENGTHS

Land Use	Size	Min Throat Length	
		Collector (ft)	Arterial (ft)
Light Industrial	< 100,000 sq. ft	25	50
	100,001-500,000 sq. ft	50	100
	> 500,000 sq. ft.	50	200
Discount Store	< 30,000 sq. ft.	25	50
	> 30,000 sq. ft.	25	75
Shopping Center	< 250,000 sq. ft.	25	50
	250,001-500,000 sq. ft.	50	75
	500,001-750,000 sq. ft.	75	200
	> 750,000 sq.ft.	125	250
Supermarket	< 20,000 sq. ft.	50	75
	> 20,000 sq. ft.	75	125
Apartments	< 50 units	25	25
	50-100 units	25	50
	100-200 units	50	75
	> 200 units	75	125
Quality Restaurant	< 15,000 sq. ft.	25	50
	> 15,000 sq. ft.	25	75
Drive-in Restaurant	< 2,0000 sq. ft	25	75
	> 2,0000 sq. ft.	50	100
General Office	< 50,000 sq. ft.	25	50
	50,001-100,000 sq. ft.	25	75
	100,001-200,000 sq. ft.	50	100
	200,001-500,000 sq. ft.	100	150
	> 500,000 sq. ft.	125	250
Motel	< 150 rooms	25	75
	> 150 rooms	25	100

**3-7 TRAFFIC CONTROL SIGNING AND STRIPING**

All traffic control devices, signing, striping and other pavement delineation shall conform to the Manual on Uniform Traffic Control Devices (MUTCD). It shall be the developer’s responsibility to furnish all materials and labor as required to install all traffic control as required by the city traffic engineer. All shown on the street improvement plans prior to plan approval.

### 3-8 TRAFFIC STUDIES

#### A. Responsibility for Traffic Studies

All traffic studies are governed by the Traffic Mitigation Ordinance and all rules adopted pursuant thereto. The applicant is urged to contact the City Traffic Engineer prior to beginning a traffic study.

Traffic studies are required by the city for all developments in the city that develop 50 or more “peak hour” trips in either the A.M. or P.M. peak hour, or deemed necessary by the city’s traffic engineer. Developments that develop less than the 50 trip threshold have the option of paying a fee of \$80.00 per daily or preparing a traffic study to outline the impacts and mitigations. The primary responsibility for assessing the traffic impacts associated with a proposed development will rest with the developer, with the city serving in a review capacity.

The study is the responsibility of the applicant and must be prepared by a registered professional engineer with adequate experience in transportation traffic and/or transportation planning.

#### B. Traffic Study Format

1. Land Use:

A brief description of the size of the land parcel, general terrain features and location within the city must be included in this section. In addition, the roadways that afford access to the site, and are included in the study area, must also be identified.

2. Existing and Proposed Uses:

The existing and proposed uses of the site must be identified. The intent of the traffic study is to evaluate the traffic impacts due to the development. If the final use is not clear, the land use with the greatest overall traffic impact must be assumed for the study.

3. Project Trip Generation and Distribution

The project trip generation is to be determined by the latest approved edition of the ITE Trip Generation Manual, unless otherwise required or approved by the city traffic engineer.

The developments peak hour trips are to be distributed through the street network to a level of 10 peak hour trips.

4. Existing and Projected Volumes:

Existing traffic volumes including turning movement counts will be provided by the city when available. Growth shall be calculated at 4% per year compounded annually.

Separate graphics shall be provided for the existing volumes, for the site generated volumes, and for the cumulative SEPA project volumes. An additional graphic shall be provided compiling all of the information at the horizon year. Volumes including turning movements shall be shown throughout the study area for normal and peak hours.

5. The following Tables should be provided in the study:

**Table A**

<b>LEVELS OF SERVICE (LOS)</b>				
<b>Intersection</b>	<b>Existing</b>	<b>1998 w/project</b>	<b>1998 w/o projects</b>	<b>1998 w/mitigations</b>

**Table B**

<b>VOLUME</b>					
<b>Roadway Section Intersection</b>	<b>Project a.m. p.m.</b>	<b>Existing a.m. p.m.</b>	<b>1998 a.m. p.m.</b>	<b>Proj. Vol. as % of Diff.</b>	<b>Proj. Vol. as % of Total</b>
	<b>(1)</b>	<b>(2)</b>	<b>(3)</b>	<b>1/(302)</b>	<b>1/3</b>

**NOTE:** The horizon year is normally 5 years from the date of project application. A horizon year of 1998 is used here for illustrative purposes only.

6. Traffic Accidents:

Traffic accident information may be required for affected street corridors and intersections. The study period will normally be 3 years. Information is available from the city.

Estimates of increased or decreased accident potential must be evaluated for the development, particularly if the proposed development might impact existing traffic safety problems in the study area. Safety mitigation measures must be included where necessary.

7. Recommendations:

In the event that analysis indicates unacceptable Levels of Service (LOS) in the study area, a description and cost estimate of the proposed improvements to return intersection to an acceptable LOS is required. The cost estimates should be all inclusive and include any additional right-of-way as required.

8. The Study shall also analyze the interface of entrances and exits with the city street system. The study shall also make recommendations regarding site circulation for both vehicles and pedestrians including handicap access.

**3-9 UNDERGROUND UTILITIES**

**3-9.1 GENERAL**

1. The WSDOT/APWA Standard Specifications shall apply unless otherwise stated below.
2. When trenching through existing pavement, the open cut shall be a neat line made by either saw cutting or jackhammering a continuous line. Saw cutting will be required unless the cut is made prior to reconstruction or an overlay.
3. Temporary pavement patch shall be accomplished by using cold mix (MC 250), ATB or steel plates.
4. Permanent pavement patch shall be as specified on Standard Drawing No. 316.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

5. Where trench excavation equals or exceeds a depth of 4 feet, the developer/contractor shall provide, construct, maintain and remove, as required, safety systems that meet the requirements of the Washington Industrial Safety and Health Act, RCW 49.17, including WAC 296-155. The trench safety systems shall be designed by a qualified person, and meet accepted engineering requirements (see WAC 296-155-660).
6. The developer/contractor shall furnish, install, and operate all necessary equipment to keep excavations above the foundation level free from water during construction, and shall dewater and dispose of the water so as not to cause injury to public or private property or nuisance to the public. Sufficient pumping equipment in good working condition shall be available at all times for all emergencies, including power outage, and shall have available at all times competent workmen for the operation of the pumping equipment. Water pumped from the trench shall be disposed of using best management practices and shall not be pumped into streams nor to storm drains near streams.
7. Compaction tests will be required to ensure adequate compaction on all lifts. All compaction tests shall be considered by a licensed testing laboratory at the expense of the developer/contractor. See Section 3-4.4 of these Specifications.
8. Reference to the City Engineer below means the city's representative on site.
9. Water setting of backfill in trenches is not permitted.

### 3-9.2 TRENCH EXCAVATION

The length of trench excavation in advance of pipe laying shall be kept to a minimum and in no case shall exceed 150 feet unless specifically authorized by the City Engineer. The maximum permissible trench width between the foundation level to the top of the pipe shall be 40 inches for pipe 15 inches or smaller inside diameter; or 1-1/2 I.D. plus 18 inches for pipe 18 inches or larger. If the maximum trench width is exceeded without written authorization of the City Engineer, the developer/contractor will be required to provide pipe of higher strength classification or to provide a higher class of bedding, as required by the City Engineer.

### 3-9.3 TRENCH BACKFILL

Suitable native material excavated during trenching shall be used for trench backfill unless notified by the City Engineer that the native material is unsuitable. The City Engineer or his representative will examine excavated native material at the time of excavation to determine its suitability for use as backfill. Native material will be considered suitable for trench backfill if it is:

- a) Capable of attaining the degree of compaction specified in Section 3-9.4 Compaction.
- b) Within reasonable tolerance of optimum moisture content.
- c) Reasonably free of organic material, clay, frozen lumps, rocks or other deleterious matter.

Unsuitable backfill material shall be removed from the site and hauled to an approved disposal site. The City Engineer shall be provided with the location of all disposal sites to be used and also copies of the permits and approvals for such disposal sites.

Imported material shall meet the requirements of Gravel Borrow as specified in Section 3-20.2 of these Standards or Crushed Surfacing Top Course as specified in Section 9-03.3(3) of the WSDOT/APWA Standard Specifications and Section 3-20.5 of these Standards.

### **3-9.4 COMPACTION**

Trench backfill shall be spread in layers and compacted by mechanical tampers of the impact type approved by the City Engineer. The backfill material shall be placed in successive layers with the first layer not to exceed 2 feet above the pipe, and the following layers not exceeding 12 inches in loose thickness with each layer being compacted to the density specified below:

- a) Improved areas such as street and sidewalks shall be compacted to 90% of maximum dry density to within 3 feet of subgrade. The last 3 feet shall be compacted to 95% of maximum dry density.
- b) Unimproved area or landscape areas shall be compacted to 90% of maximum dry density.

### **3-9.5 TRENCHING LONGITUDINAL TO ROADWAY**

Sewer, water and storm lines that are within the roadway section and longitudinal to the roadway shall be backfilled with native material or Gravel Borrow as approved by the City Engineer to the pavement patch level or subgrade, whichever applies. All other utility cuts such as gas, telephone, power, and cable TV shall be backfilled with controlled density fill.

### **3-9.6 TRENCHING TRANSVERSE TO ROADWAY**

Utility trenching that crosses transversely to the roadway alignment will generally not be permitted unless it can be shown that alternatives such as jacking, auguring or tunneling are not feasible or unless the utility can be installed just prior to reconstruction or an overlay of the road. Should an open cut be approved, the trench shall be backfilled with controlled density fill. When high ground water levels are encountered, relief drains shall be installed at 15 feet intervals to prevent damming. The relief drains shall be 3 inch PVC and placed at a minimum 3 feet from finished grade or as otherwise approved by the City Engineer.

### **3-9.7 JACKING, AUGERING, OR TUNNELING**

Tunneling may be ordered by the City Engineer under pavements, buildings, railroad tracks, etc. The developer/contractor shall install the pipe by jacking, auguring or tunneling, or installing the pipe in a casing pipe by a combination of these methods.

When use of a casing pipe is required, the developer/contractor shall be responsible to select the gauge and size required, unless otherwise indicated on the drawings, and consistent with his jacking or auguring operation, and shall be set to line and grade. During jacking or auguring operations, particular care shall be exercised to prevent caving ahead of the pipe which will cause voids outside the pipe. When the carrier pipe is installed within a casing pipe, the carrier pipe shall be skidded into position in an acceptable manner and to the line and grade as designated. The annular space between the casing and the pipe shall be filled with controlled density fill or as otherwise approved.

The faces of the jacking pit shall be constructed by driving steel sheets, or installing timber lagging as the excavation proceeds. The sheets, or lagging, shall extend a minimum of 5 feet below the bottom of the pit except at the entrance of the utility. Prior to jacking or auguring activities, shop drawings describing these activities, including dimensioning of pit length and size of underground borings and complete description of shoring, shall be submitted to the City Engineer for approval.

### **3-10 SURVEYING AND MONUMENTATION**

#### **3-10.1 DESCRIPTION**

This work shall consist of all the surveying and monumentation required to construct the project as described in the plans and these Specifications.

It shall be the responsibility of the developer/contractor to furnish materials and install monuments and castings in accordance with the drawings and where directed by the engineer. All survey work shall be performed by or under the direct supervision, of a Professional Land Surveyor (PLS) licensed in the State of Washington. Monument and monument case and cover shall be supplied and installed per Standard Plan No. 313.

Surveying, as required to construct a given project per the approved plans, shall be furnished by the developer at no expense to the city. It is required that survey stakes be set for new curb and gutter construction, for both horizontal and vertical control. Additionally, any water, storm drain, or sanitary sewer mains which are to be constructed in easements are to have survey offset stakes set prior to starting that work, and any deviation from that staked line must be left uncovered and resurveyed to realign easement as required and for corrected as-built information.

#### **3-10.2 MATERIALS**

Materials for monumentation shall be Class 3000 concrete or commercial concrete per Section 6-12 of the WSDOT/APWA Standard Specifications and the monument case and covers shall be gray iron castings conforming to the requirements of AASHTO M 105, Class 30B. The cover and seat shall be machined so as to have perfect contact around the entire circumference and full width of bearing surface.

#### **3-10.3 CONSTRUCTION REQUIREMENTS**

Monuments shall be located at all centerline intersections of intersecting streets. Curved streets shall be monumented at centerline PI's (point of intersection), if it falls within the street pavement, otherwise the PC (point of curvature) and PT (point of tangency) of the curve shall be monumented.

It shall be the developer's/contractor's responsibility to provide the surveying required to establish or perpetuate land corner monumentation as may be required on the project.

All land corner surveying shall conform to the requirements of RCW 58.09. If the developer's or contractor's surveyor replaces or restores an existing or obliterated "General Land Office" (GLO) corner(s), it shall be their responsibility to file "Land Corner Records" for these monuments with the Snohomish County Auditor's Office.

When all land corners have been established, replaced or restored and monumented as described herein, the surveyor shall certify this information with a letter to the City Engineer. This certification letter shall include the location of the monumented corner(s) and that all land corner(s) have been monumented as described herein.

The city reserves the right to check survey points and/or the correct locations and elevations of new construction. These spot-checks will not change the requirements for normal checking and testing as described elsewhere, and do not relieve the contractor of the responsibility of producing a finished product that is in accordance with the contract. If unacceptable errors are found due to errors or omissions by the contractor's survey activities, then the contractor shall correct these error including removing and replacing improvements and pay all expenses incurred by the city including the re-survey.

### **3-11 STREET ILLUMINATION**

Street lights shall be provided in plats and for commercial developments. Street light poles shall be aluminum with a concrete base. Special ornamental poles may be installed with approval of the City Traffic Engineer. The luminaires may be supplied and maintained by Snohomish County PUD. Special luminaires, which are not supplied by the PUD, must be approved by the City Traffic Engineer. All street light wiring, conduit and service connections shall be located underground.

Street light locations must be approved by the City Traffic Engineer.

The installation of special luminaires, not provided by the PUD, shall be the responsibility of the developer. The luminaires shall be full cut –off type and street light locations shall attempt to minimize illumination of salmonid streams to reduce the risk of predation.

### **3-12 GUARDRAILS**

Unenclosed floor and roof openings, open and glazed sides of stairways, landings and ramps, balconies or porches, which are more than 30 inches above grade or floor below, and roofs used for other than service of the building shall be protected by a guardrail. See Sections 1712 and 3306 of the latest edition of the Uniform Building Code for specific requirements.

For Safety Rail see Section 3-16 of these Standards and Standard Drawing Nos. 325, 325A and 326.

Roadway guardrails shall conform to WSDOT/APWA Standard Plan C-1, Beam Guardrail Type 1. Guardrail anchors shall conform to WSDOT/APWA Standard Plan C-6, Guardrail Anchor Type 1. For local streets, end treatment shall conform to WSDOT/APWA Standard Plan C-6, Guardrail Anchor Type 1. For Principal arterials, Minor arterials, collector arterials, or other locations where the end of the guardrail is subject to head-on impacts, a crash tested guardrail terminal shall conform to WSDOT/APWA Standard Plan C-4b and C-4e. All concrete barrier and bridge rails shall have guardrail transition sections with appropriate end treatments. Redirectional landforms are not allowed for permanent installations.

### **3-13 MAILBOXES**

New residential developments shall have mailboxes installed similar to Standard Plan Nos. 320 and 321A, or gang box supplied by the U.S. Postal Service similar to Standard Plan No. 321.

- A. When mailboxes are located adjacent to the sidewalk, the sidewalk shall be widened to provide a clear width of not less than 5 feet from back of curb to any portion of the mailbox structure, per Standard Plan No. 321.
- B. In the case of new road construction or reconstruction requiring mailboxes to be moved back or rearranged, the builder shall coordinate with the U.S. Postal Service through the Everett Postmaster in the main Post Office in Everett, for acceptable box locations and to ensure uninterrupted mail service. Approved locations for mailboxes shall be shown on street construction plans.

### **3-14 PAVEMENT PATCHING**

#### **3-14.1 DESCRIPTION**

This work shall consist of the patching of various types of pavement cuts, the performances of which shall be in accordance with these Specifications, the WSDOT/APWA Standard Specifications and Standard Plan No. 315.

#### **3-14.2 MATERIALS**

All materials shall conform to the requirements specified for material in other sections of the WSDOT/APWA Standard Specifications as follows:

- A. Asphalt concrete pavement patch shall be HMA Class ½" PG 64-22 meeting the requirements of Section 5-04.
- B. Asphalt for temporary patch shall be MC 250 meeting the requirements of Section 9-02.
- C. Cement concrete pavement patch shall be Class 4000 HES meeting the requirements of Section 6-02.
- D. Crushed Surfacing Top Course shall meet the requirements of Section 9-03.0(3).
- E. Permeable pavement shall be replaced in-kind where feasible. Replacing permeable pavement with conventional pavement materials may be acceptable if the patch area represents a small percentage of the total permeable pavement facility area and does not impact the overall facility function.

#### **3-14.3 CEMENT CONCRETE PAVEMENT RESURFACED WITH ASPHALT CONCRETE**

Streets which have cement concrete pavements surfaced with asphalt concrete shall be patched as shown on Standard Drawing No. 316.

The cement concrete portion of the patch shall be Class 4000, HES. The thickness shall be 1 inch thicker than the existing concrete base or 6 inches, whichever is greater. The top surface of the concrete patch shall match the top surface of the existing concrete base; in no case shall the top of the concrete be higher than the top of the existing concrete base. Brush finishing will not be required. Joints shall be placed to match existing or as directed by the engineer.

Asphalt concrete plant mix shall not be placed until 3 days after the cement concrete base has been placed or otherwise permitted by the engineer. The asphalt concrete plant mix shall not be placed until the concrete base has received a tack coat of CRS-2 at a rate of 0.12 to 0.20 gallons per square yard. The edges of the existing asphalt and castings shall also be painted with the tack coat. The asphalt concrete pavement shall then be placed, leveled, and compacted to conform to the surface of the existing asphalt pavement. Immediately, thereafter, all joints between the new and original asphalt pavement shall be painted with CSS-1 asphalt emulsion and covered with dry sand before the asphalt solidifies.

Asphalt shall be compacted to 92% of maximum density as determined by WSDOT Test Method 705.

#### **3-14.4 ASPHALT CONCRETE ON GRANULAR BASE**

After the Crushed Surfacing Top Course subgrade has been leveled and compacted, asphalt concrete pavement shall be placed to a thickness of 1 inch greater than the existing asphalt pavement depth or to a minimum of 3 inches, whichever is greater. Asphalt shall be compacted to 92% of maximum density as determined by WSDOT Test Method 705.

### **3-14.5 UNTREATED ROADWAY SURFACES**

Existing crushed rock, gravel, and oil mat streets shall be restored with Crushed Surfacing Top Course to a compacted depth of 4 inches within the neat lines of the trench. Crushed surfacing shall be mixed, placed, spread and shaped in accordance with the requirements of Section 4-04 of WSDOT/APWA Standard Specifications. Compaction shall be as specified by one of the methods shown in Section 3-14.7(1) of these Specifications.

### **3-14.6 TEMPORARY PAVEMENT PATCHING**

The contractor shall furnish, place and maintain temporary pavement patching, at locations as directed by the engineer, until such time as a permanent patch of permanent paving can be made.

Temporary pavement patch shall consist of a 2 inch thick course of cold mix asphalt (MC 250) over a 4 inch course of Crushed Surfacing Top Course. The crushed surfacing shall be compacted to 96% maximum density as determined by one of the methods described in Section 3-14.7(1) of these Specifications. Asphalt shall be compacted to 90% of maximum density as determined by WSDOT Test Method 705.

Temporary asphalt patching shall be required where roadway or walk is needed for vehicular or pedestrian traffic, during the construction period, until permanent pavement and sidewalks can be constructed.

In the event that the temporary surface subsides after the initial placement, additional MC 250 and Crushed Surfacing shall be applied to maintain the surface.

### **3-14.7 CONSTRUCTION REQUIREMENTS**

#### **3-14.7(1) GENERAL**

Pavement patching shall be scheduled to accommodate the demands of traffic and shall be performed as rapidly as possible to provide maximum safety and convenience to public traffic.

The placing and compaction of the trench backfill and the preparation and compaction of the subgrade shall be in accordance with the various applicable sections of the WSDOT/APWA Standard Specifications except as modified by these Specifications.

Before the pavement patch is to be constructed the pavement shall be saw cut so that the marginal edges of the patch will form a rectangular shape with straight edges and vertical faces.

Signs, barricades, lights and other warning devices shall be installed per the requirements of the "Manual on Uniform Traffic Control Devices" and they shall be maintained 24 hours a day until the patching work is completed and ready for traffic.

Take appropriate precautions during pavement repair and replacement efforts to prevent clogging of adjacent permeable materials.

Compaction of the subgrade shall be completed prior to the required patching. Subgrade compaction shall be to 95% as determined by one of the following methods:

ASTM D1556	(sand cone method)
ASTM D2167	(rubber balloon method)
ASTM D2922	(nuclear method)

### 3-14.7(2) CEMENT CONCRETE PAVEMENT

After the Crushed Surfacing Top Course subgrade for the pavement has been constructed and compacted to line and grade, the cement concrete pavement patch shall be placed and struck off to a thickness of 1 inch greater than the existing pavement or 8 inch minimum, whichever is greater. All work shall be in accordance with Section 5-05 of the WSDOT/APWA Standard Specifications, except as modified by these Specifications and Standard Drawing No. 316.

Through joints and dummy joints shall be placed to match existing or as directed by the engineer. The surface of the concrete patch shall be finished and brushed with a fiber brush. Approved curing compound shall be placed on the finished concrete immediately after finishing.

### 3-15 ROCKERIES AND ROCKWALLS

#### 3-15.1 DESCRIPTION

This work shall consist of constructing rockeries with rock facing height of 8' or less used for erosion control or the containment of cuts and embankments. Work shall be performed in accordance with these Specifications and Standard Plan No. 324. Rockeries over 8' in height must be designed by a civil engineer licensed in the State of Washington.

#### 3-15.2 MATERIALS

All rock shall be sound, angular ledge rock that is resistant to weathering. The longest dimension of any individual rock should not exceed three times its shortest dimension. Acceptability of rock will be determined by laboratory tests as hereinafter specified, geologic examination and historical usage records.

All rock delivered to and incorporated in the project shall meet the following minimum specifications:

a. Absorption ASTM C127 AASHTO T085	<i>Not more than 2.0% for igneous and metamorphic rock types and 3.0% for sedimentary rock types.</i>
b. Accelerated Expansion (15 days) CRD-C-148*1, *2	<i>Not more than 15% breakdown.</i>
c. Soundness (MgSO <sub>4</sub> at 5 cycles) ASTM C88 or CRD-C-137	<i>Not greater than 5% loss.</i>
d. Unconfined Compressive Strength ASTM D 2938	<i>Intact strength of 6,000 psi, or greater.</i>
e. Bulk Specific Gravity (155pcf) ASTM C127 or AASHTO T-85	<i>Greater than 2.48.</i>

\*1. The test sample will be prepared and tested in accordance with Corps of Engineers Testing Procedure CRD-C 148, "Method of Testing Stone for Expansive Breakdown on Soaking in Ethylene Glycol."

\*2. Accelerated expansion tests should also include analyses of the fractures and veins found in the rock.

The density of the rock shall be equal to, or greater than, one hundred fifty-five (155) pcf. Typically, rocks used for rock wall construction shall be sized approximately as shown on Standard Plan 324.

Rockery caps will be required on all rockeries higher than four (4) feet in the public right-of-way and optional on private property. The cement concrete cap shall be a minimum of two (2) inches thick. Concrete for Rockery Cap shall be Class 3000 or Commercial. Lamp black coloring agent to match the color of the rockery shall be added to the cement concrete during mixing in an amount not to exceed 1 ½ pounds per cubic yard of concrete. Where a pedestrian or ornamental handrail is required, the rockery cap shall be deepened to a minimum of twelve (12) inches for a section six (6) inches either side of each pipe sleeve. Dummy joints shall be constructed at twelve (12) foot intervals. The depth of the dummy joint shall be one-third the depth of the cap.

### **3-15.3 GENERAL**

Surfaces reasonably accessible to pedestrians above and adjacent to rockeries over 30" in height shall be protected by a guardrail conforming to Section 1712 of the Uniform Building Code and to Section 3-16 of these Specifications.

A Public Works permit is required for all rock walls within the public right-of-way and for all those exceeding 4 feet in height on private property.

### **3-15.4 CONSTRUCTION REQUIREMENTS**

The first step in rock wall construction, after general excavation, is to construct a keyway of at least twelve (12) inches in depth, extending for the full length of the rock wall. The keyway shall be slightly inclined back towards the face being protected. Once the competency of the keyway subgrade to support the rock wall is verified, a shallow ditch or trench, approximately twelve (12) inches wide and deep, shall be dug along the read edge of the keyway. A four-inch diameter perforated or slotted high-density polyethylene (HDPE), smooth interior pipe shall be placed in the trench. This stormwater conveyance pipe shall be installed with sufficient slope to initiate flow and the outfall connected to a positive and permanent discharge.

The contractor shall have sufficient space available so that he can select from among a number of stockpiled rocks for each space in the rock wall to be filled. Rocks which have shapes which do not match the spaces offered by the previous course of rock should be placed elsewhere to obtain a better fit. Rocks shall be of a generally cubical, tubular or rectangular shape. Any rocks of basically rounded or tetrahedral form shall be rejected or used for filling large void spaces.

The first course of rock shall be placed on firm unyielding soil. There shall be full contact between the rock and soil, which may require shaping of the ground surface or slamming or dropping the rocks into place so that soil foundation conforms to the rock face bearing on it. The bottom of the first course of rock shall be a minimum of twelve (12) inches below the lowest adjacent site grade.

As the rock wall is constructed, the rocks shall be placed so that there are no continuous joint planes in either the vertical or lateral direction. Whenever possible, each rock shall bear on at least two rocks below it. Rocks should be placed so that there is some bearing between flat rock faces rather than on joints. Joints between courses (the top surface or rock) shall slope back towards the cutface and away from the rock wall.

Because of the nature of the product used to construct a rock wall, it is virtually impossible to avoid creating void spaces between individual rocks. Where voids of greater than six inches in dimension exist in the face of a rock wall, they shall be visually examined to determine if contact between the rocks exists within the thickness of the rock wall. If there is no rock contact within the rock wall thickness, the void shall be chinked with a smaller piece of rock.

A rock drainage filter shall be installed between the rear face of the rock wall and the soil face being protected. This drain rock layer shall be at least twelve (12) inches thick. For rock walls eight (8) feet in height or higher, it shall be at least eighteen (18) inches thick. The material for the drainage filter shall be Quarry Rock, as specified in Section 3-20.7 of these Specifications.

### **3-16 METAL HAND RAILINGS**

#### **3-16.1 DESCRIPTION**

This section applies to providing and building metal hand railings that meet the requirements of the Plans, these Specifications and the City Engineer.

#### **3-16.2 MATERIALS**

Materials shall meet the requirements of the following:

##### **Ornamental Handrail**

Ornamental handrail shall be constructed in accordance with Standard Plan No. 326 and these Specifications. Horizontal rails and vertical support posts shall be 1 ½ inches by 1 ½ inches by 1/8 inch tubular steel conforming to ASTM A120. Balusters shall be ½ inch by ½ inch and the horizontal bottom rail 1-1/2 inches by ½ inch by 1/8 inch channel steel (ASTM A120). Vertical support posts shall be a maximum 8 feet on center and balusters a maximum 4 inches per space. The center of the bottom rail shall be a maximum of 4 inches above finished grade. Finished height of the railing shall be 42 inches above the pedestrian walking surface. Provide slip joints at stairway expansion joints and at 24 feet on center maximum.

##### **Pedestrian Handrail (Galvanized Steel and Aluminum)**

Galvanized Steel and Aluminum pedestrian handrail shall be constructed in accordance with Standard Plan Nos. 325 and 325A and these Specifications. Horizontal rails and vertical support posts shall be 1-1/2 inch diameter Schedule 40 Standard pipe and balusters shall be ¾ inch diameter Schedule 40 Standard Pipe. Vertical support posts shall be on 8 foot centers and balusters on 4 inches clear space. Finished height of the railing shall be 42 inches above the pedestrian walking surface. Provide slip joints at stairway expansion joints and at 24 feet on center maximum.

#### **3-16.3 FABRICATION**

Before fabricating the railing, the contractor shall submit 6 copies of the shop plans for the engineer's approval. The contractor may substitute other rail connection details for those shown in the plans if details of these changes show in the shop plans and if the engineer approves. In approving shop plans, the engineer indicates only that they are adequate and complete enough. Approval does not indicate a check on dimensions.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Welding shall conform to the requirements of the “Structural Welding Code” AWS D1.1 for steel, and to the requirements of the “Specifications for Aluminum Structures” of the Aluminum Association, for aluminum alloys. All exposed welds shall be ground flush with adjacent surfaces.

Railing panels shall be straight and true to dimensions. Adjacent railing panels shall align with each other with a variation not to exceed 1/16 inch. Joints shall be matchmarked.

For structures on curves, either horizontal or vertical, the railing shall conform closely to the curvature of the structure by means of series of short chords. The lengths of the chords shall be the distance center to center of rail posts.

Steel railing units shall be galvanized after fabrication. Zinc used for galvanizing shall be grade Prime Western conforming to ASTM B6 with a minimum 2 ounces per square foot.

Completed aluminum railing units shall be anodized after fabrication conforming to the requirements of the Aluminum Class 1 Anodic Coating, AA-C22-A41.

Ornamental railing shall be painted with a rust proof metal primer and one coat of black ornamental iron metal paint.

### 3-16.4 INSTALLATION

The railing shall be erected in accordance with the plans on anchor bolts, or in holes formed by inserts provided in the concrete railing base to receive the railing posts. Sheet metal inserts shall be removed before the erection of the railing.

No railing shall be erected on the structure until the sidewalk to which it is to be attached is completed and all falsework supporting the system is released.

The railing shall be carefully erected, true to line and grade. Posts and balusters shall be vertical with the direction from the vertical for the full height of the panel not exceeding 1/8 inch.

Slip joints shall be as shown on Standard Drawing Nos. 325, 325A and 326. Railing installed without slip joints will be rejected and the contractor shall install new railing at his own expense.

### 3-17 CEMENT CONCRETE SIDEWALKS

#### 3-17.1 DESCRIPTION

This work shall consist of constructing cement concrete sidewalks, thickened edge for sidewalks, curb ramps, and bus shelter pads, including excavation for the depth of the sidewalk and subgrade preparation, in accordance with these Specifications, the WSDOT/APWA Standard Specifications and Standard Drawings Nos. 306, 306A, 310A thru 310C and 311.

#### 3-17.2 MATERIALS

Materials shall meet the requirements of the following section of the WSDOT/APWA Standard Specifications:

Cement Concrete Class 3000	6-02
Portland Cement	9-01
Aggregates	9-03

Premolded Joint Filler	9-04
Concrete Curing Materials and Admixtures	9-23

Slump of concrete mix shall not exceed 3-1/2 inches. Lamp black coloring agent for matching the color of newly constructed cement concrete sidewalks to the color of adjacent existing cement concrete sidewalks shall be added to the concrete during mixing in an amount not to exceed 1-1/2 pounds per cubic yard of concrete. No lamp black shall be used in curb ramps. The use of Calcium Chloride as an admixture is prohibited.

### **3-17-.3 CONSTRUCTION REQUIREMENTS**

#### **3-17.3(1) GENERAL**

The curb and gutter section shall be placed prior to the placement of the sidewalk section unless otherwise directed by the engineer.

Subgrade shall be approved by the public works inspector prior to concrete being placed. Generally, ¼ inch V-grooves deep are to be placed on 5 feet centers, but at the discretion of the inspector this may be changed to make for a better match with the surrounding area. Expansion joints shall be placed to match those placed in curbs if new sidewalk is poured adjacent a curb and gutter, in all other cases the maximum spacing on expansion joints shall be 30 feet center to center. Dummy joints shall be ½ inch by 1-1/2 inch on 15 foot centers. Through joints shall be ½ inch by 4 inches.

A minimum distance of 3 feet is required from the face of curb to any obstruction on or within the sidewalk unless otherwise noted.

It is expected there will be sufficient suitable native material excavated from various portions of the improvement to fill low areas in the sidewalk subgrade and planting strip area when needed.

Where there is insufficient suitable native material on the project site, the contractor shall furnish, place and compact Gravel Borrow. All sidewalks shall be constructed over a minimum 2 inches of Crushed Surfacing Top Course meeting the requirements of Section 3-20.5 of these Specifications and Sections 9-03.9(3) of the WSDOT/APWA Standard Specifications compacted to 95% of maximum density.

#### **3-17.3(2) FORMS AND FINE GRADING**

Wood forms shall be 2"x4" (nominal) in lengths of not less than 10 feet. Steel forms may be used upon approval of the engineer. Forms shall be staked to a true line and grade. A subgrade template shall then be set upon the forms and the fine grading completed so that the subgrade will be a minimum of 3-5/8 inches below the top of the forms. Forms shall be provided around all street name sign posts and traffic sign posts that are placed in concrete areas. Forms used for this purpose shall be 1 foot square or 1 foot minimum diameter cutout, as approved by the engineer.

#### **3-17.3(3) PLACING AND FINISHING CONCRETE**

The concrete shall be spread uniformly between the forms and thoroughly compacted with a steel shod strikeboard. Through joints and dummy joints shall be located and constructed in accordance with the Standard Plans. In construction of through joints, the premolded joint filler shall be adequately supported until the concrete is placed on both sides of the joint.

Whenever castings are located in the sidewalk area, joints shall be installed at the casting location to control cracking of the sidewalk. If spacing of joints or scoring is such that installation of joint material would be unsuitable, the contractor shall install rebar to strengthen the sidewalk section.

Dummy joints shall be formed by first cutting a groove in the concrete with a tee bar of a depth equal to, but not greater than the joint filler material, and then working the premolded joint filler into the groove. Premolded joint filler for both through and dummy joints shall be positioned in true alignment at right angles to the line of the sidewalk and be normal to and flush with the surface. Where the sidewalk will be contiguous with the curb, it shall be constructed with a thickened edge as shown on Standard Plan No. 306A.

After the concrete has been thoroughly compacted and leveled, it shall be floated with wood floats and finished at the proper time with a metal float.

The surface shall be brushed with a fiber hair brush of an approved type in a transverse direction except that at driveway and alley crossings it shall be brushed longitudinally. The placing and finishing of all sidewalk shall be performed under the control of the engineer, and the tools used shall meet with his approval. After brush finish, the edges of the sidewalk and all joints shall be lightly edged again with an edging tool to give it a finished appearance.

The surface finish and joint pattern may vary at the direction of the engineer in order to match existing sidewalk.

#### **3-17.3(4) CURING AND PROTECTION**

The curing materials and procedures specified in Section 5-05.3(13) of the WSDOT/APWA Standard Specifications shall prevail, except that white pigment curing compounds shall not be used on sidewalks.

The contractor shall have readily available sufficient protective covering, such as waterproof paper or plastic membrane, to cover the pour of an entire day in event of rain or other unsuitable weather.

The sidewalk shall be protected against damage or defacement of any kind until it has been accepted by the engineer. Sidewalk which is not acceptable to the engineer because of damage or defacement, shall be removed and replaced by the contractor.

#### **3-17.3(5) CURING AND HOT WEATHER**

In periods of low humidity, drying winds, or high temperatures, a fog spray shall be applied to concrete as soon after placement as conditions warrant in order to prevent the formation of shrinkage cracks. The spray shall be continued until conditions permit the application of a liquid curing membrane or other during media. The engineer shall make the decision when the use of a fog spray is necessary.

#### **3-17.3(6) COLD WEATHER WORK**

When the air temperature is expected to reach the freezing point during the day or night, the concrete shall be protected from freezing. The contractor shall provide a sufficient supply of straw, hay, grass, earth, blankets, or other suitable blanketing material and spread it over the pavement to a sufficient depth to prevent freezing of the concrete. The contractor shall be responsible for the quality and strength of the concrete thus cured. Any concrete injured by frost action or freezing shall be removed and replaced at the contractor's expense in accordance with these Specifications.

### 3-17.3(7) THROUGH AND CONTRACTION JOINTS

Standard locations for through joints for sidewalks are:

- a) At street margins produced and at 30 foot intervals.
- b) To separate concrete driveway, stairways, curb ramps and their landings from sidewalks.
- c) Around the vertical barrel of fire hydrants, around utility poles and large diameter underground utility cover castings when located in the sidewalk area.
- d) Longitudinally between concrete walks, curbs, paved planting strips and solid masonry or concrete walls where they abut.
- e) To match as nearly as possible, the through joints in the adjacent pavement and curb when sidewalk abuts to curb.

Transverse contractions joints (dummy joints) shall be constructed with premolded material 3/8 inch wide by 2 inches depth, and set at 15 foot intervals, or as decided by the engineer. At no time will dummy joint spacing exceed 15 feet.

Transverse and longitudinal through joints as shown on Standard Plan No. 307 shall be 3/8 inch thickness premolded non-extruding joint material, cut to a width equal to the full depth of the concrete where located, plus 1/2 inch. When installed, they shall be placed with top edge 1/8 inch below the finished surface of the concrete, in a perpendicular plane to the surface and with the bottom edge embedded in the subgrade. All joints shall be in straight alignment, except where placed in curved locations.

Construction joints for sidewalks shall conform to the applicable requirements for through joints. The top edge shall be 1/8 inch below the finished surface of the sidewalk. At no time will joint spacing exceed 15 feet.

### 3-17.3(8) CURB RAMPS

In accordance with State law, curb ramps shall be provided at all pedestrian crossing with curb sections. It is required that when a ramp is constructed giving handicap access to the roadway area, the corresponding ramp at the opposite side of the roadway will also be required. Exact locations at each curb return will be approved in the field during construction.

Curb ramps shall be constructed in accordance with the Standard Plan Nos. 310A, 310B, 310C and 311. Curb ramps shall be constructed where shown on the plans or as described by the engineer. This work shall include curb ramps installed in new sidewalks and curb ramps to be installed in existing sidewalks. Existing sidewalks shall be neatly saw-cut full depth prior to construction of curb ramps.

Curb ramps shall be constructed separately from the sidewalk to produce a definite break line between the ramp and the sidewalk. A 3/8 inch non-extruded through joint material shall be installed between the curb ramp and the sidewalk with edging.

Ramp texturing is to be done with an expanded metal grate placed and removed from wet concrete to leave a diamond pattern as shown. The long axis of the diamond pattern shall be perpendicular to the curb. Grooves shall be 1/8 inch deep and 1/4 inch wide.

Curb ramps will not be poured integral with sidewalk and shall be isolated by expansion joint material on all sides, but not at end of ramp adjacent to the roadway.

### **3-18 CURB AND GUTTER**

#### **3-18.1 DESCRIPTION**

The standard curb and gutter section used in Everett shall be Type A-1 per Standard Plan No. 305A. No new curb and gutter is to be placed until forms have been checked and approved for line, grade and compaction by the public works inspector.

#### **3-18.2 MATERIALS**

Materials shall meet the requirements of the following Sections of the WSDOT/APWA Standard Specifications:

Portland Cement	9-01
Concrete Aggregate	9-03
Reinforcing Steel	9-07
Premolded Joint Filler	9-04
Curing Compounds	9-23

The Portland Cement Concrete shall meet the requirements of Sections 5-05 of the WSDOT/APWA Standard Specifications. Concrete mix for curbs shall be Class 3000. Slump of the concrete shall not exceed 3 ½ inches.

All new curb and gutter shall be placed over not less than 2 inches of Crushed Surfacing Base Course compacted to 95% maximum density.

Forms may be of wood or metal at the option of the contractor, provided that the forms as set will result in a curb, or curb and gutter of the specified thickness, cross section, grade and alignment shown on the drawings and Standard Plan No. 305A.

#### **3-18.3 PLACING CONCRETE**

The subgrade shall be properly compacted and brought to specified grade before placing concrete. The subgrade shall be thoroughly dampened immediately prior to the placement of concrete. Concrete shall be spaded and tamped thoroughly into the forms to provide a dense, compacted concrete free of rock pockets. The exposed surfaces shall be floated, finished and brushed longitudinally with a fiber hair brush approved by the engineer.

The rate of concrete placement shall not exceed the rate at which the various placing and finishing operations can be performed in accordance with these Specifications.

If concrete is to be placed by the extruded method, the contractor shall demonstrate to the satisfaction of the engineer that the machine is capable of placing a dense, uniformly compacted concrete to exact section, line and grade.

### 3-18.4 CURING

Transparent curing compounds shall be applied to all exposed surfaces immediately after finishing. Transparent curing compounds shall contain a color dye of sufficient strength to render the film distinctly visible on the concrete for a minimum period of 4 hours after application.

The contractor shall have readily available sufficient protective covering, such as waterproof paper or plastic membrane, to cover the pour of an entire day in event of rain or other unsuitable weather.

Additional requirements for curing in hot weather shall be as specified in Section 3-17.3(5) of these Specifications. Additional requirements for curing in cold weather may be found in Section 3-17.3(6) of these Specifications.

### 3-19 CEMENT CONCRETE DRIVEWAYS

#### 3-19.1 DESCRIPTION

This work shall consist of cement concrete driveway and alley returns constructed at the locations shown on the drawings and where directed by the engineer, and shall be in accordance with these Specifications, the WSDOT/APWA Standard Specifications and Standard Plan Nos. 307, 308, and 309.

Type 1 driveways should only be used where there is likely to be limited stormwater runoff in the gutter line or adequate drainage facilities exist to prevent street stormwater from flowing onto adjacent properties.

#### 3-19.2 MATERIALS

Materials shall meet the requirements of the following sections of WSDOT/APWA Standard Specifications:

Portland Cement	9-01
Fine Aggregate	9-03
Coarse Aggregate	9-03
Joint Materials	9-04
Curing and Admixtures	9-23

The concrete mix shall be as specified for Class 3000 and the slump of the concrete shall not exceed 3 inches.

A minimum of 2 inches of Crushes Surfacing Base Course shall be compacted to 95% maximum density prior to any placement of concrete.

#### 3-19.3 CONSTRUCTION REQUIREMENTS

##### 3-19.3(1) GENERAL

No driveway approach shall project beyond the extension of the side property line to the curb, unless the owner of the adjacent property is a co-signer of the driveway permit.

There must be at least 20 feet of full height curb between driveways serving any one property frontage.

The City Engineer shall have the authority to restrict the number, size and location of access driveways.

**DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS**

There must be at least 6 feet of full height curb between driveways on adjacent lots.

Driveway locations, lengths, etc. are further clarified in the Everett Municipal Code and must conform accordingly. In critical on-street parking areas, additional off-street parking space(s) are required for the on-street spaces eliminated by any driveway(s).

Driveway aprons shall be constructed per Standard Plan Nos. 307, 308, or 309 as applicable. The minimum thickness of the driveway apron shall be 6 inches, placed over a minimum of 2 inches of Crushed Surfacing Base Course compacted to 95% maximum density over a compacted subgrade. In all cases, subgrade and rock grade shall be approved by the public works inspector prior to concrete being placed. Driveway aprons over 15 feet wide shall have an expansion joint placed in the center of the apron.

In locations where a new driveway is to be constructed and sidewalk and curb and gutter is already existing, it must be totally removed and replaced to driveway standards. It is not permissible to “knock-off” existing curb and install driveway apron, the total curb and gutter section must be removed, either by sawcutting or to the nearest expansion joint, and replaced to driveway standards.

New driveways installed in areas where curb and gutter improvements are not existing, and not required to be installed, shall be paved from the existing edge of pavement to the property line regardless of whether the remainder of the driveway on the private property is paved.

In areas not fully improved with curbs and sidewalks, the elevation of the driveway at the point where it crosses the property line shall not be more than 3 inches higher than the elevation of the centerline of the existing paved street if driveway is rising on the private property side and no lower than level with the elevation of the centerline of the existing street if the driveway is going down on the private property side.

**3-19.3(2) COMMERCIAL DRIVEWAYS**

When allowed, driveways located closer than 200 feet from the approach to an arterial intersection shall be signed and marked “Right Turn Only” unless otherwise approved by the city traffic engineer.

A. Commercial Driveway Width:

Street Posted Speed <u>MPH</u>	Driveway Max Width* <u>feet</u>
25	30
26-45	36
Over 45	42

\*Dimension “1” on Standard Plan Nos., 307, 308, and 309.

The minimum width of driveway shall be 20 feet.

B. Grade:

The maximum recommended grade is 8%. Vertical curves should be used for smooth transitions at significant grade differentials.

### 3-19.3(3) RESIDENTIAL DRIVEWAYS

- A. **Width:** The maximum width shall be 20 feet at dimension "1" on Standard Plan Nos., 307, 308 and 309.
- B. **Grade:** The maximum recommended grade is 15%. (20% for modifications to existing driveways.) Grade changes that exceed 16% shall require vertical curves to connect tangents.

### 3-19.3(4) INTERSECTION TYPE CRITERIA

Private intersection type driveway openings will be considered in lieu of conventional driveways in commercial areas where the criteria A through D below are met. Meeting the criteria is not a guarantee that an intersection type driveway will be allowed.

- A. Projected driveway usage is greater than 1,000 vehicles per day.
- B. The opening is at least 160 feet from any other intersection.
- C. The opening is at least 160 feet from any other driveway on the property frontage under control of the applicant.
- D. A minimum 100 feet storage area is provided between the curb line on the street and any turning or parking maneuvers within the development.

### 3-19.3(5) EXCAVATION AND SUBGRADE

Where directed by the engineer, unsuitable material in the subgrade shall be removed to a specific depth and backfilled with select material such as Gravel Borrow conforming to Section 3-20.2 of these Specifications.

Before any concrete is placed, the contractor shall bring the subgrade to the required line, grade and cross-section. The contractor shall maintain the subgrade in the required condition until the concrete is placed. Compaction shall be to 95% standard density.

### 3-19.3(6) FORMS AND FINE GRADING

Forms for the straight sections of the driveway or alley return shall have a minimum thickness of 2 inches and be equal to the nominal depth of the concrete. Plywood or 1 inch lumber may be used on radii. All forms shall be securely staked and blocked to true line and grade.

A template shall be set upon the forms and the subgrade shall be fine graded to conform to the required section. The subgrade shall then be compacted to the approval of the engineer. Prior to placement of the concrete, the subgrade shall be thoroughly dampened.

### 3-19.3(7) PLACING AND FINISHING

The concrete shall be spread uniformly between the forms and thoroughly compacted with an approved type of strikeboard. Through joints and contraction joints shall be located and constructed in accordance with the Standard Plans. In the construction of through joints, the premolded joint filler shall be adequately supported until the concrete is placed on both sides of the joint.

Contraction joints (dummy joints) shall be formed with a tee bar by first cutting a groove in the concrete to a depth equal to, but not greater than the joint filler material and then working the premolded joint filler into the groove. Premolded joint filler for both through and dummy joints shall be positioned in true alignment and at right angles to the center line of the driveway or alley return.

After the concrete has been thoroughly compacted and leveled, it shall be floated with wood floats and finished at the proper time with a metal float. Joints shall be edged with ¼ inch radius edger and the driveway or alley return edges shall be tooled with ½ inch radius edger.

The surface shall be brushed in a transverse direction in relation to the center line of the driveway or alley return with a fiber hair brush of approved type.

### **3-19.3(8) CURING AND PROTECTION**

The curing materials and procedures specified in Sections 5-05 and 9-23 of the WSDOT/APWA Standard Specifications and Section 3-17.7 of these Specifications shall be used. The driveway and the alley return shall be protected against damage or defacement of any kind until acceptance by the Owner. Any driveway or alley return not acceptable, in the opinion of the engineer because of damage or defacement, shall be removed and be replaced by the contractor.

Before placing any concrete, the contractor shall have on the job site enough protective paper to cover the pour of an entire day, in event of rain or other unsuitable weather conditions.

### **3-20 PROPORTIONING OF MATERIALS**

#### **3-20.1 CONTROLLED DENSITY FILL (CDF)**

CDF shall conform to the following specifications:

1. Portland Cement: Type I-II ASSHTO M85.
2. Mineral Filler Admixtures: pozzolans or fly ash (ASTM C-618, Class F).
3. Aggregate: Washed Coarse Sand.

CDF shall be used in the following proportions for 1 cubic yard. Batch weights may vary depending on specific weights of aggregates.

Portland Cement	50 lbs/yd <sup>3</sup>
Fly Ash	250 lbs/yd <sup>3</sup>
Washed Coarse Sand (SSD)	3,200 lbs/yd <sup>3</sup>
Water	50 gals/yd <sup>3</sup> (Max)

Add sufficient water to provide a 6 inch to 8 inch slump delivered in place at the job site.

**3-20.2 GRAVEL BORROW**

The gradation for Gravel Borrow in Section 9-03.14 of the WSDOT/APWA Standard Specifications is superseded by the following:

<u>U.S. Standard Sieve Size</u>	<u>Percent Passing By Dry Weight</u>
3 inch	100
2 inch	85 - 100
1-1/4 inch	75 - 100
No. 4	30 - 70
No. 40	0 - 25
No. 200	5 Max.
Sand Equivalent	50 Min.

**3-20.4 SPAWNING GRAVEL**

Spawning Gravel shall be clean, well-rounded, uniformly graded and shall conform to the following gradation:

<u>Sieve Size</u>	<u>Percent Passing</u>
4" Square	100
3" Square	85 - 95
1-1/2" Square	65 - 75
1/2" Square	0 - 50
1/4" Square	2 Max.

All percentages are by weight.

**3-20.5 CRUSHED SURFACING**

Crushed Surfacing Top Course and Crushed Surfacing Base Course shall meet the requirements of Section 9-03.9(3) of the WSDOT/APWA Standard Specifications.

**3-20.6 FOUNDATION MATERIAL CLASS A**

Foundation Material Class A shall meet the requirements of Section 9-03.17 of the WSDOT/APWA Standard Specifications.

**3-20.7 QUARRY SPALLS**

Quarry Spalls shall meet the requirements of section 9-13.6 of the WSDOT/APWA Standard Specifications.

### 3-20.8 NON-SHRINK CEMENT SAND GROUT

Non-shrink cement sand grout shall be proportioned as follows:

- 1 part high early strength (H.E.S.) cement.
- 2 parts clean fine-grained sand by weight and well-mixed with sufficient water to obtain a stiff consistency.

Unpolished aluminum powder shall be added to the dry cement in the proportion of one heaping teaspoonful per sack of cement no more than 30 minutes before the grout mixture reaches its final in-place position.

The required strength of the non-shrink concrete or grout shall be  $f_c=4,000$  psi and be verified by the cube strength test. The strength shall be confirmed by schmidt hammering of the pads.

Prior to placing the grout, the contact surface shall be thoroughly cleaned, roughened and wetted with water. The grout shall be covered with burlap sacks after the initial concrete set and wetted at regular intervals until the required strength is obtained.

## SECTION 4 - STORM AND SURFACE WATER

### 4-1 GENERAL

This section of the Standards provides criteria for the design of storm and surface water drainage systems, including stormwater conveyance pipes, culverts, and catch basins, on-site stormwater management, flow control, and water quality treatment facilities. Each of the sections in this chapter contains the design criteria and reference standard details for the various systems or facilities.

Drainage control and stormwater treatment shall be provided for all property improvements within the City of Everett per these Standards, the City of Everett Stormwater Management Manual, Everett Municipal Code Sections 14.28 and 14.56, the City's Surface Water Comprehensive Plan, and the City's Zoning Code.

The City of Everett Stormwater Management Manual shall be the Washington State Department of Ecology's *Stormwater Management Manual for Western Washington*, current edition. All requirements of the manual shall be the City of Everett's requirements, except as modified herein. This requirement will apply to all new and redevelopment projects and activities within the City of Everett unless one of the following applies:

- The project site is legally served by a combined storm and sanitary sewer system
- The project type or activity is included in the list of exempt practices included in the City of Everett Stormwater Management Manual
- The activity is a part of regular operations permitted under an individual NPDES permit or a separate General Permit issued by the Washington Department of Ecology, except the Construction Stormwater General Permit.
- The activity is covered under the WSDOT Stormwater General Permit and is designed in accordance with the WSDOT Highway Runoff Manual, provided that any more restrictive City of Everett requirements are met.
- The Director, at his discretion, may allow roadway and transportation related projects to be designed in accordance with the WSDOT Highway Runoff Manual provided that any more restrictive City of Everett requirements are met.
- Drainage facilities conceived, designed, or constructed by or through an agent of the City shall be exempted from the submittal and permitting requirements of the City of Everett Stormwater Management Manual. The City shall meet the intent and specific requirements of the manual on all projects relative to drainage or incorporating drainage components and shall maintain records adequate to reflect such compliance. These records shall be available upon request per the State Public Disclosure of Information Act, RCW 42.17.

#### 4-1.1 NATURAL BUFFER AREAS

Natural buffer areas protect drainage courses from erosion and pollutants. Natural buffer areas will be required adjacent to all wetlands and other environmentally sensitive areas, per the City's Critical Areas Ordinance (Title 19, Chapter 37 of the Everett Municipal Code (EMC)).

Natural required buffer areas may not be used to provide treatment for stormwater runoff, nor may concentrated flows that could cause erosive damages be discharged through natural required buffer areas.

#### 4-2 STORM DRAINAGE CONVEYANCE SYSTEM DESIGN CRITERIA

##### 4-2.1 OVERVIEW

For the purposes of this section, the conveyance system includes all portions of the surface water system that transport storm and surface water runoff, either natural or man-made, except those features protected as environmentally sensitive areas under the City's zoning code. Environmentally sensitive areas may only be modified as allowed under the City of Everett Zoning Code. Stormwater must generally be treated and detained prior to discharge to an environmentally sensitive area, including those features created for mitigation.

This section covers the following components of the conveyance system:

- Pipe systems
- Culverts
- Outfalls
- Open Channels

##### 4-2.2 DESIGN FLOW AND ROUTE REQUIREMENTS

###### 4-2.2 (1) DESIGN FLOW

The method used to determine the design flow will depend on the characteristics of the drainage area and the type of conveyance. Refer to Section 4-3.1 for appropriate methods for calculating design flows.

The design flow for each conveyance system category is as follows:

- Private Property –
  - The project's internal drainage system shall be designed for a 25-year recurrence interval peak flow rate from the contributing drainage area under fully developed conditions.
- Public Roads and other Public Rights of Way
  - All conveyances within public roads or other public rights of way shall be designed to pass a 25-year recurrence interval peak flow rate from the contributing drainage area under fully developed conditions.
- Culverts and Bridges –
  - Culverts for and bridges over natural channels shall be designed to safely convey the 100-year recurrence interval peak flow rate from the contributing drainage area under fully developed conditions.
  - Culverts and bridges shall also be designed to meet fish passage requirements, where applicable.

A backwater analysis (see Section 4-2.2(3)) may be required for a proposed or existing pipe system if the ability of the pipe system to convey the peak rate of runoff from the 25-year design storm event may be affected by tailwater conditions (outlet control) anywhere in the pipe system.

#### 4-2.2 (2) CONVEYANCE SYSTEM LOCATION

New conveyance system alignments that are not in dedicated tracts or right-of-way shall be located in drainage easements that are adjacent and parallel to property lines. The width of the permanent easement must be completely within a single parcel or tract and not split between adjacent properties. Topography and existing conditions are the only conditions under which a drainage easement may be placed that is not adjacent and parallel to a property line.

1. A drainage easement with a minimum width of 15 feet shall be provided for publicly maintained open channels, closed drainage systems, and from established city streets to a stormwater facility.
2. Pipes installed in public easements shall be constructed in the center of the easement, as nearly as possible, but in no case shall the pipe be within five feet of any structure or property line.
3. No structures shall be erected within any public drainage easement. Construction of a fence across a public easement is allowed provided a 15-foot wide access gate is provided.
4. All public easements, except for special circumstances, shall be located to run within single lots rather than being split by a lot line.
5. All man-made drainage facilities and conveyances and all natural channels (on the project site) used for conveyance of altered flows due to development shall be located within easements or dedicated tracts as required by the City. Easements shall contain the natural features and facilities and shall allow City access for purposes of inspection, maintenance, repair or replacement, flood control, water quality monitoring, and other activities permitted by law.
6. All drainage facilities such as detention or retention ponds or infiltration systems to be maintained by the City shall be located in separate tracts dedicated to the City. Conveyance systems for these facilities can be in easements or as part of the drainage facility tract.
7. Drainage facilities that are designed to function as multi-use recreational facilities shall be located in separate tracts or in designated open space and shall be privately maintained and owned, unless dedicated to and accepted by the City.
8. All publicly and privately maintained stormwater conveyance systems shall be located in dedicated tracts, drainage easements, or public rights-of-way in accordance with this manual. Exceptions are roof downspout, minor yard, and footing drains unless they serve other adjacent properties.
9. Any new conveyance system located on private property designed to convey stormwater runoff from other private properties must be located in a private drainage easement granted to the contributors of stormwater to the systems to convey surface and stormwater and to permit access for maintenance or replacement in the case of failure.
10. All drainage tracts and easements, public and private, must have a minimum width of 15 feet.
11. All pipes and channels must be located within the easement so that each pipe face or top edge of channel is no closer than 5 feet from its adjacent easement boundary.
12. Pipes greater than 5 feet in diameter and channels with top widths greater than 5 feet shall be placed in easements adjusted accordingly so as to meet the required dimensions from the easement boundaries.
13. Minimum separation from other pipes:
  - 6 inches vertical (with bedding) and in accord with the City Sewer Utility Design criteria.
  - 3 feet horizontal

#### 4-2.2 (3) PIPE SYSTEM DESIGN CRITERIA

Two methods of hydraulic analysis using Manning's Equation are used for the analysis of pipe systems. The first method is the Uniform Flow Analysis Method, commonly referred to as the Manning's Equation, and is used for the design of new pipe systems and analysis of existing pipe systems.

The second method is the Backwater Analysis Method. If the City determines that, as a result of the project, runoff for any event up to and including the 100-year peak frequency flow would cause damage or interrupt vital services, a backwater (pressure sewer) analysis shall be required. A backwater analysis shall also be used when the outlet of the pipe system being analyzed is fully or partially submerged or can be expected to be so during the design storm event. Examples of where this may be encountered include discharge to a river, tidally influenced waterbody, stormwater pond or a low gradient open channel conveyance system.

When a backwater calculation is required, the design engineer shall analyze the 25- and 100-year peak flows and demonstrate compliance with the requirements in section 4-2.2(1):

- For the 25-year recurrence peak flow rate, there shall be a minimum of one-half a foot of freeboard between the water surface and the top of any manhole or catch basin.
- For the 100-year recurrence peak flow rate:
  - Overtopping of the pipe conveyance system may occur; however, the additional flow shall not extend beyond half the lane width of the outside lane of the traveled way and shall not exceed 4 inches in depth at its deepest point.
  - Off-channel storage on private property is allowed with recording of the proper easements. The additional flow shall be analyzed by open channel flow methods.

Results of the backwater analysis shall be provided to the City in tabular and graphic format showing hydraulic and energy gradient.

When using the Manning's Equation for design, each pipe within the system shall be sized and sloped such that its barrel capacity at normal full flow is equal to or greater than the design flow rate.

Table 4-2.2(3) provides the recommended Manning's "n" values for preliminary design for pipe systems. (Note: The "n" values for this method are 15 percent higher in order to account for entrance, exit, junction, and bend head losses.)

Manning's "n" values used for final pipe design must be documented in the Stormwater Site Plan.

Nomographs may also be used for sizing the pipes. For pipes flowing partially full, the actual velocity may be estimated from engineering nomographs by calculating  $Q_{full}$  and  $V_{full}$  and using the ratio of  $Q_{design}/Q_{full}$  to find  $V$  and  $d$  (depth of flow). Refer to the most current version of WSDOT's Hydraulics Manual for nomographs and additional guidance on the design of pipe systems.

**Table 4.2.2(3) Recommended Manning’s “n” Values for Preliminary Pipe Design**

Type of Pipe Material	Analysis Method	
	Backwater Flow	Manning's Equation Flow
A. Concrete pipe and CPEP-smooth interior pipe	0.012	0.014
B. Annular Corrugated Metal Pipe or Pipe Arch:		
1. 2 $\frac{2}{3}$ x $\frac{1}{2}$ inch corrugation (riveted)		
a. plain or fully coated	0.024	0.028
b. paved invert (40% of circumference paved):		
(1) flow full depth	0.018	0.021
(2) flow 0.8 depth	0.016	0.018
(3) flow 0.6 depth	0.013	0.015
c. treatment 5	0.013	0.015
2. 2.3 x 1-inch corrugation	0.027	0.031
3. 3.6 x 2-inch corrugation (field bolted)	0.030	0.035
C. Helical 2 $\frac{2}{3}$ x $\frac{1}{2}$ -inch corrugation and CPEP-single wall	0.024	0.028
D. Spiral rib metal pipe and PVC pipe	0.011	0.013
E. Ductile iron pipe cement lined	0.012	0.014
F. High density polyethylene pipe (butt fused only)	0.009	0.009

**4-2.3 PIPE SYSTEMS**

Pipe systems are networks of stormwater conveyance pipes, catch basins, manholes, inlets, and outfalls designed and constructed to convey surface and stormwater runoff. The hydraulic analysis of flow in stormwater conveyance pipes is typically limited to “gravity flow”. The following subsections give design criteria for different components and aspects of pipe systems.

**4-2.3(1) PIPE MATERIALS**

1. Pipe material, joints, and protective treatment shall conform to the requirements set forth in Section 9-05 of the WSDOT/APWA Standard Specifications.

The following pipe materials are allowed for use in pipe systems in the City of Everett; other pipe materials may be approved on a case-by-case basis:

- a) Plain concrete pipe (12 inches in diameter, used only for driveway culvert)
  - b) Reinforced concrete pipe
  - c) Ductile iron pipe
  - d) Galvanized or aluminized corrugated iron or steel pipe, treatment 1 through 6 (not to be used in city maintained systems unless approved in advance by the City Engineer)
  - e) PVC pipe (SDR35, ASTM D3034 with 3 feet of cover, minimum)
  - f) Corrugated high density polyethylene pipe, with smooth interior
2. Coupling bands shall be of the same material as the pipe.

**DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS**

3. Materials for concrete, rubber gaskets, metal castings, reinforcing steel, and masonry units shall meet the requirements of the appropriate sections of the WSDOT/APWA Standard Specifications.
4. Galvanized or aluminized pipe are not permitted in marine environments or where salt water may occur, even infrequently through backwater events.

**4-2.3(2) PIPE SIZES, SLOPES, AND VELOCITIES**

1. No stormwater conveyance pipe between catch basins or manholes in the public right-of-way shall be less than 12 inches in diameter, with the exception that 8-inch pipe may be used between inlets and catch basins in runs of 50 feet or less.
2. The minimum velocity in any pipe or culvert carrying the design storm flow shall be 2 feet per second, unless otherwise approved.
3. The maximum allowable velocity in concrete pipe shall be 30 feet per second.
4. Changes of pipe size are allowed only at junctions, and structures must be located at all junctions.
5. Downstream decrease in pipe size is not a recommended practice and will only be allowed under special conditions, where approved by the Public Works Director.
6. Stormwater conveyance pipe used for private roof/footing/yard drain systems may be less than 8-inch diameter and sized according to the application.

**4-2.3(3) STRUCTURES**

1. Manholes, catch basins, and inlets shall be constructed of pre-cast units in accordance with the following Standard Plans:

<u>Item</u>	<u>Section</u>
Manholes	605A-C
Catch Basins	402 through 404
Inlets	401
Steps and Ladder	606, 606A
Frames and Grates	405 through 409

2. Catch basin (or manhole) diameter shall be determined by pipe size and orientation at the junction structure. A plan view of the junction structure, drawn to scale, will be required when more than four pipes enter the structure on the same plane, or if angles of approach and clearance between pipes is of concern. The plan view (and sections if necessary) must ensure a minimum solid concrete wall distance between pipe openings of 8 inches for 48 inch and 54 inch catch basins and 12 inches for 72 inch and 96 inch catch basins.
3. Catch basin evaluation of structural integrity for H-20 loading may be required for multiple junction catch basins and other structures.
4. Catch basins shall be provided within 50 feet of the entrance to a pipe system to provide for silt and debris removal.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

5. HDPE pipe systems longer than 100 feet must be secured at the upstream end and the downstream end must be placed in a 4 foot section of the next larger pipe size. The sliding sleeve connection accounts for the high thermal expansion/contraction coefficient of this pipe material.
6. The maximum slope of the ground surface for a radius of 5 feet around a catch basin grate shall be 3:1.
7. A Type II catch basin or a manhole shall be required when the depth to the flow-line exceeds 5.5 feet, regardless of the pipe size.
8. All Type II catch basins and all manholes shall be equipped with ladders per Standard Plan No. 606 or 606A.
9. A Type II catch basin shall be installed as the last collector in the public right-of-way prior to discharge to the combined sanitary sewer.
10. Concrete inlets shall not be used where the discharge goes directly into the main storm drain system.

### **4-2.3(4) PIPE ALIGNMENT/CONNECTIONS/COVER**

1. Pipes must be laid true to line and grade with no curves, bends, or deflections in any direction, except for HDPE and ductile iron with flanged restrained mechanical joint bends (not greater than 30 degrees) on steep slopes. Tracer wire shall be applied to all HDPE pipe which deviates from a straight line and grade.
2. A catch basin or manhole will be required at all changes in storm drain diameter and changes in grade or alignment.
3. Connections to a pipe system shall be made only at catch basins or manholes. No wyes or tees are allowed except on roof, footing, or yard drain systems on pipes 8 inches in diameter or less, with clean-outs upstream of each wye or tee.
4. 6 inches minimum vertical and 3 feet minimum horizontal clearance (between outside surfaces) shall be provided between storm drain pipes and other utility pipes and conduits.
5. Any closed storm drainage system collecting runoff from paved areas in the public right-of-way or private property shall provide for floatable material separation (see Standard Plan No. 410) prior to discharge to the main storm drainage system in the public right-of-way, unless otherwise approved by the City Engineer.
6. All PVC connections to catch basins or manholes shall be made by grouting in an approved manhole adapter into which the PVC pipe is inserted.
7. Activities such as trench excavation, tunneling or boring, pipe embedment, backfilling, compaction, safety and pavement patching, whether for public or private utilities, shall conform to the requirements set forth in other Sections of these Standards. For all the above, except pavement patching, see Section 3-9 Underground Utilities and Standard Plan Nos. 610, 611, and 615. For pavement patching see Section 3-14 and Standard Plan No. 316.

**4-2.3(5) FRAMES/LIDS/GRATES/COVERS**

1. In general, frames and grates shall be furnished and installed per Standard Plan Nos. 405 through 409.
2. The cover or grating of a manhole or catch basin shall not be grouted to final grade until the final elevation of the pavement, gutter, ditch, or sidewalk in which it is to be placed has been established, and until permission thereafter is given by the City inspector to grout the cover or grating in place.
3. Lids, grates, and covers shall be seated properly to prevent rocking.
4. All catch basins and manholes in unpaved areas shall be equipped with locking frames and lids or grates per Standard Plan Nos. 405 or 607.
5. Vaned grates, in accordance with Standard Plan No. 411, shall be provided for all inlets and catch basins within the public right of way, except that solid covers shall be used where the structure is not intended to collect surface flow. Bi-directional vaned grates in accordance with Standard Plan No. 411 should be provided in sag vertical curves where gutter line flow approaches from both directions.
6. Herringbone grates may be used only on private systems. Herringbone grates are best suited to uses where surface flow approaches from multiple directions, such as in a parking lot. Vaned grates are recommended for use adjacent to curb lines and any other situation where flow generally approaches the grate from a single direction.
7. All Type II catch basins and all manholes with catches shall be supplied with locking lids or grates per standard plan No. 406, 409, 410, and 411.
8. Type II catch basins and manholes functioning exclusively as access structures shall be equipped with round 24 inch covers and framed per Standard Plan No. 610.
9. Round lids on all storm drain structures shall have "Drain" cast into the lid.
10. In conditions when the effectiveness of a normal grate installation would be limited, an open curb face frame and grate shall be furnished and installed per Standard Plan Nos. 412. These conditions include high likelihood of clogging from leaf fall, especially in sag vertical curves; when the inlet is a surface drainage end point, such as a cul-de-sac; and when normal inlet grates may be passed over due to the road grade. The use of open curb face frame and grates must be approved by the City Engineer.

**4-2.3(6) RESTRICTOR DEVICES**

1. The minimum orifice size diameter allowed for use in the City of Everett is one half inch.
2. The minimum width of a notch allowed for use in the City of Everett is one quarter inch.
3. Restrictor devices shall be constructed and installed in accordance with Standard Plan No. 415.
4. Proprietary flow restricting devices may be considered on a case by case basis. Proprietary devices must demonstrate acceptance by the Washington Department of Ecology prior to use within the City of Everett.

**4-2.3(7) FLOW SPLITTER DEVICES**

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

1. Flow splitter devices shall be designed in accordance with Section 4.5 of Volume V of the Stormwater Management Manual.
2. Flow splitters shall be constructed and installed in accordance with Standard Plans number 422 through 424. Other flow splitter designs may be used if they are designed based on demonstrable sound hydraulic principles and are consistent with the material requirements herein.
3. The maximum head should be minimized for flow in excess of the water quality design flow. Specifically, flow to the water quality facility should not increase above the design water quality flow by more than 10 percent when the water level in the flow splitter is at a 100-year level. Flow splitters designed for uses other than bypassing water quality facilities may be designed to proportionately distribute high flows or other criteria as appropriate to the use.
4. Materials used in flow splitter construction shall comply with the requirements for Restrictor Devices as defined in Section 4-2.3(6). Risers and other appurtenances within the splitter shall be manufactured from aluminum, stainless steel, or plastic materials. Steel (except stainless) materials will not be accepted.
5. Flow splitter designs which incorporate a baffle wall shall ensure access to each side of the baffle wall. If the baffle wall exceeds 36 inches in height, or if the separation between the top of baffle and underside of the structure lid is insufficient to allow maintenance access, two separate access points shall be provided.

### **4-2.3(8) DEBRIS BARRIERS**

Debris barriers (trash racks) are required on all pipes entering or leaving a closed pipe system, including pipes entering or leaving a control/restrictor manhole or catch basin from a surface-type BMP (detention pond, infiltration basin, wetpond, biofiltration swale, etc.). See Standard Drawing 217 for debris barriers fabrication requirements.

### **4-2.3(9) DRAINAGE EASEMENTS**

1. Public drainage easements a minimum of 15 feet wide are required for maintenance and access of pipes located outside of the public right-of-way which convey runoff from public streets or other facilities.
2. Where possible, pipes shall be located within the center of the drainage easement, but in no case shall a pipe be closer than five feet to a property line.
3. Where possible, drainage easements shall be contained on one lot, and not bisected by a lot line.
4. Shared private pipes must be located within private drainage easements.
5. Easements for downspout roof drains, yard drains, and footing drains are not required unless these systems are shared by more than one property owner.

### **4-2.3(10) PAVEMENT DRAINAGE**

Stormwater collection systems shall be designed to prevent flooding of driving surfaces which inhibits safe travel and loss of function during heavy rainfall events. Drainage collection systems for public roadways shall be designed in accordance with Chapter 5 of the current version of the WSDOT Hydraulics Manual, or as required by the City Engineer. In lieu of preparing calculations described in the Hydraulics manual catch basins on continuous grade roadways may be determined based on the following minimum spacing requirements.

**DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS**

Minimum Catch Basin Spacing on Continuous Grade Roads (LF)				
Longitudinal Road Slope (%)	Road Width (ft)*			
	0-12	12-24	24-36	36-48
0-1	400	220	150	100
1-2	550	300	200	150
2-5	600	400	250	200
5-8	600	425	250	210
8+	600	400	**	**

\* Road width draining to gutter line. Typically the width from roadway crown to curb line.

\*\* Calculations must be prepared based on in accordance with the methods in the Hydraulics Manual

Note that the restrictions on pipe lengths between structures must also be met and may reduce catch basin spacing.

Collection systems on private property shall be designed such that ponding depths do not exceed 4 inches in depth in the 25 year storm event in areas subject to vehicular traffic. Ponding depths should be further reduced in areas commonly subject to pedestrian traffic. Grate inlets in parking areas should generally be modeled as broad crested weirs. The length of the weir should be calculated as the perimeter length of the weir divided by 2 to account for debris plugging.

**4-2.4 CULVERT DESIGN CRITERIA**

**Culverts shall be designed in accordance with the following criteria:**

1. Minimum Culvert Velocity shall be 3 feet per second and a maximum culvert velocity shall be 15 feet per second. Thirty feet per second may be used with an engineered outlet protection design.
2. No maximum velocity for ductile iron or HDPE pipe shall be established but outlet protection shall be provided.
3. All CPEP and PVC culverts and pipe systems shall have concrete or rock headwalls at exposed pipe ends.
4. Bends are not permitted in culvert pipes.
5. The following minimum cover shall be provided over culverts:
  - 2 feet under roads.
  - 1 foot under roadside applications and on private property, exclusive of roads.
6. If the minimum cover cannot be provided on a flat site, use ductile iron pipe and analyze for loadings.
7. Maximum culvert length = 250 feet
8. Minimum separation from other pipes:
  - 6 inches vertical (with bedding) and in accord with the City Sewer Utility Design criteria.

3 feet horizontal.

Trench backfill shall be bank run gravel or suitable native material compacted to 95 percent Modified Proctor test to a depth of 2 feet; 90 percent below 2 feet compacted in 8 inch to 12 inch lifts.

All driveway culverts shall be of sufficient length to provide a minimum 3:1 slope from the edge of the driveway to the bottom of the ditch. Culverts shall have beveled end sections to match the side slope.

#### **4-2.4(1) HEADWATER**

1. For new culverts 18 inches in diameter or less, the maximum allowable 25-year design storm headwater elevation (measured from the inlet invert) shall not exceed two times the pipe diameter/arch culvert height used and shall be one foot or more below the road or parking lot subgrade.
2. For new culverts larger than 18 inches in diameter, the maximum 25-year design storm headwater elevation for the new culvert shall be one foot or more below the road or parking lot subgrade.
3. No Culvert shall have a headwater elevation which overtops the roadway in the 100-year design storm.
4. For bottomless culverts the maximum 25-year design storm headwater shall not exceed the top of the culvert.

#### **4-2.4(2) INLET**

1. For culverts 18 inches in diameter and larger, the embankment around the culvert inlet shall be protected from erosion by rock lining or riprap as specified in Table 4-2.1, except the length shall be a minimum of five feet (upstream of the culvert) and the height shall be at the design headwater elevation.
2. Trash racks/debris barriers are required on culverts that are over 60 feet in length and that are 12 inches to 36 inches in diameter. Exceptions are culverts on fish-bearing streams.
3. In order to maintain the stability of roadway embankments, concrete headwalls, wing walls, or tapered inlets and outlets may be required if right-of-way and/or easement constraints prohibit the culvert from extending to the toe of the embankment slope. Normally, concrete inlet structures/headwalls installed in or near roadway embankments must be flush with and conform to the slope of the embankment.

#### **4-2.4(3) OUTLETS**

The receiving channel at the outlet shall be protected from erosion by rock lining, as specified in Table 4-2.1, except the height shall be one foot above the maximum tailwater elevation or one foot above the crown of the pipe, whichever is higher.

#### **4-2.4(4) MINIMUM CULVERT SIZE**

Minimum culvert diameters are as follows:

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

For cross culverts under public roadways – minimum 18 inches, 12 inches if grade and cover do not allow for 18 inches.

For roadside culverts, including driveway culverts, minimum 12 inches.

For culverts on private property, minimum 8 inches.

### 4-2.4(5) FISH PASSAGE

Guidance for designing culverts for fish passage must be obtained from the Washington State Department of Fish and Wildlife.

### 4-2.4(6) ADDITIONAL REQUIREMENT FOR CULVERTS OVER 20 FEET

Culverts exceeding 20 feet in width are defined as bridges and must be designed to bridge design standards. The federal definition of a bridge is a structure, including supports, erected over a depression or obstruction, such as water, highway, or railway, and having a track or passage way for carrying traffic or other moving loads with a clear span as measured along the center line of the roadway equal to or greater than 20'. The interior cell walls of a multiple box are ignored as well as the distance between the multiple pipes if the distance between pipes is less than  $D/2$  (i.e. a 16' culvert on a 45 degree skew is a bridge, a 10' culvert on a 60 degree skew is a bridge, three 6' pipes two feet apart is a bridge).

Culverts which qualify as bridges must be designed in accordance with applicable sections of the most current edition of the *AASHTO LRFD Bridge Design Specifications*. The two primary types of hydraulic analysis performed on bridges are backwater and scour.

### 4-2.5 OUTFALL DESIGN CRITERIA

#### 4-2.5(1) GENERAL

1. All outfalls (at a minimum) shall be provided with rock protection per Table 4-2.1 or flow dispersal trench. For outfalls with a velocity at the design flow greater than 10 fps, a gabion dissipater or engineered energy dissipater shall be required.
2. Flow dispersal trenches shall only be used at outfalls when both criteria below are met:
  - An Outfall is necessary to disperse concentrated flows across uplands where no conveyance system exists and the Natural (existing) discharge is unconcentrated.
  - The 100 year peak flow is less than 0.5 CFS

Flow dispersal trenches shall be designed in accordance with the Stormwater Management Manual

3. Mechanisms which reduce velocity prior to discharge from an outfall are encouraged.
4. Engineered energy dissipaters, including stilling basins, drop pools, hydraulic jump basins, baffled aprons, and bucket aprons, are required for outfalls with velocity at design flow greater than 20 fps.
5. Inlet control will usually dictate outfall pipe system capacity. The inlet conditions should be carefully examined, as well as the consequences should the inlet to the pipe system become plugged or capacity exceeded.

6. All Outfall's shall be designed for the 100-year peak flow rate.

**Table 4-2.1 Outlet Protection**

Design Flow Discharge Velocity (fps)	REQUIRED PROTECTION (Minimum Dimensions)				
	Type	Thickness	Width	Length	Height
0 – 5	Riprap*	1 ft	Diameter + 6 ft	8 ft or 4x diameter, whichever is greater	Crown + 1 ft
>5 – 10	Riprap**	1 ft	Diameter + 6 ft or 3x diameter, whichever is greater	12 ft or 3X diameter, whichever is greater	Crown + 1 ft
>10 - 20	Gabion	1 ft	As required	As required	Crown + 1 ft
20+	Engineered Energy Dissipater Required				

Note: The stone for riprap shall be hard, sound, and durable and free of rock fines, soil, or other extraneous material. It shall also be free of segregation, seams, cracks, and other defects which would tend to destroy its resistance to weather.

\* Riprap for these velocities shall be reasonably well-graded with rock gradation as follows:

100% passing an 8 inch square sieve (maximum stone size = 8 inches)  
 40 – 60% passing a 6 inch square sieve (median stone size = 6 inches)  
 0 – 10% passing a 2 inch square sieve (minimum stone size = 2 inches)

\*\* Riprap for these velocities shall be reasonably well-graded with rock gradation as follows:

100% passing a 24 inch square sieve (maximum stone size = 24 inches)  
 40 – 60% passing a 16 inch square sieve (median stone size = 16 inches)  
 0 – 10% passing a 4 inch square sieve (minimum stone size = 4 inches)

Note: Riprap sizing governed by side slopes on outlet channel is assumed to be approximately 3:1

**4-2.5(2) OUTFALL SYSTEMS TRAVERSING STEEP SLOPES**

1. Outfall systems constructed of pipe segments which are banded and/or gasketed are not acceptable for traversing steep slopes. Failure of the system will result from leaks which develop at the joints.

2. Continuously fused, welded or flange bolted mechanical joint pipe systems (such as high density polyethylene pipe (HDPEP) or ductile iron pipe with flange-bolted mechanical joints) with proper anchoring shall be used for outfall systems traversing steep slopes.
3. In general, outfall pipes systems shall be installed in trenches with standard bedding on slopes up to 20 percent. On slopes greater than 20 percent, outfall pipe systems shall be placed on the ground surface with proper pipe anchored.
4. HDPEP outfall systems must be designed to address the material limitations as specified by the manufacturer, in particular thermal expansion/contraction and pressure design. Sliding sleeve connections to address thermal expansion and contraction shall be used. These sleeve connections consist of a section of the appropriate length of the next larger size diameter of pipe into which the outfall pipe is fitted. These sleeve connections must be located as close to the discharge end of the outfall as is practical.
5. Flows of very high energy will require a specifically engineered energy dissipation structure, as described above.

#### **4-2.6 OPEN CHANNEL DESIGN CRITERIA**

Open channels, either natural or artificial, may be used to convey stormwater on and from a site. In general, however, natural channels are protected as environmentally sensitive areas under the City's zoning code and may not be used to convey untreated, undetained stormwater. Alteration of these channels, including bank stabilization projects, requires special permits.

Artificial channels are those constructed from upland areas specifically to convey storm and surface water. Artificial channels include roadside ditches, grass lined swales, and rock lined channels. Where space and topography permit, open conveyances are the preferred means of collecting and conveying stormwater.

When constructing artificial channels, vegetation-lined channels are preferred when properly designed and constructed. Rock-lining may be necessary along the length of channels or at specific locations (such as bends and outfalls) when a vegetative lining will not provide adequate protection from erosive velocities.

##### **4-2.6(1) ARTIFICIAL CHANNELS**

1. Channel section geometry shall be trapezoidal. Side slopes shall not be steeper than 3H:1V for vegetation-lined channels and 2H:1V for rock-lined channels, unless the channel is engineered specifically for steeper slopes. Channel side slopes adjacent to roads shall not exceed 4:1 and will meet all other AASHTO and City road standards.
2. All constructed channels shall be compacted to a minimum 95 percent compaction as verified by a Modified Proctor test, except that compaction requirements for bio-retention swales and bio-filtration swales shall be in accordance with the requirements of the City of Everett Stormwater Management Manual.
3. Channels shall be designed with a minimum freeboard of one-half-foot when the design flow is 10 cubic feet per second or less and 1 foot when the design discharge is greater than 10 cubic feet per second.

4. Velocities must be low enough to prevent channel erosion based on the native soil characteristics or the compacted fill material. For velocities above 5 feet per second channel linings shall be designed using a shear stress analysis.
5. Water quality shall not be degraded due to passage through an open conveyance.
6. Vegetation-lined channels shall have bottom slope gradients of five percent or less and a maximum average velocity at the design flow of five 5 feet per second.
7. Rock-lined channels shall be used when design flow velocities exceed 5 feet per second. Rock lining shall be in accordance with Table 4-2.2.
8. Check dams for erosion and sedimentation control may be used for stepping down channels being used for biofiltration.
9. A maintenance access easement 15-ft-wide (minimum) is required along all publicly maintained constructed channels located on private property. However, required easement widths and building setback lines may vary with channel top width. A minimum 15-foot-wide setback must be provided between any structures and the top of the bank of the channel.

#### 4-2.6(2) CHANNEL LINING

##### 4-2.6(2)A Shear Stress Analysis

Channels which exceed velocities of 5 feet per second or slopes greater than 5 percent shall be analyzed to determine channel stability and the need for protection using a channel lining. In most cases a flexible channel lining is appropriate while extremely high shear stresses may require hard armoring. In order to determine the need for a channel lining the maximum shear stress in a channel should be calculated using the methodology below. A liner with a permissible shear stress exceeding the channel's maximum shear stress can then be selected from Table 4-2.6(2).

The maximum shear stress in a straight channel is given by:

$$\tau_d = \gamma d S_o$$

where,

$\tau_d$  = shear stress in channel at maximum depth, lb/ft<sup>2</sup>

$\gamma$  = unit weight of water, lb/ft<sup>3</sup>

d = depth of flow in channel, ft (determined using Manning's Equation)

$S_o$  = channel bottom slope, ft/ft

A more detailed discussion of the shear stress analysis, including compound liners and complex geometry can be found in the Federal Highway Administration's *Hydraulic Engineering Circular No. 15 - Design of Roadside Channels with Flexible Linings*

(<http://www.fhwa.dot.gov/engineering/hydraulics/pubs/05114/05114.pdf>.)

#### Stability in Bends

Flow around a bend creates secondary currents, which impose higher shear stresses on the channel sides and bottom compared to a straight reach. At the beginning of the bend, the maximum shear stress is near

the inside and moves toward the outside as the flow leaves the bend. The increased shear stress caused by a bend persists downstream of the bend.

The maximum shear stress in a bend is given by:

$$\tau_b = K_b \tau_d$$

where,

$\tau_b$  = side shear stress on the channel, lb/ft<sup>2</sup>

$K_b$  = ratio of channel bend to bottom shear stress

$\tau_d$  = shear stress in channel at maximum depth, lb/ft<sup>2</sup>

The maximum shear stress in a bend is a function of the ratio of channel curvature to the top (water surface) width,  $R_c/T$ . As  $R_c/T$  decreases, that is as the bend becomes sharper, the maximum shear stress in the bend tends to increase.  $K_b$  can be determined from the following equation:

$$\begin{array}{ll} K_b = 2.00 & R_c/T \leq 2 \\ K_b = 2.38 - 0.206 \left(\frac{R_c}{T}\right) + .0073 \left(\frac{R_c}{T}\right)^2 & 2 < R_c/T < 10 \\ K_b = 1.05 & 10 \leq R_c/T \end{array}$$

where,

$R_c$  = radius of curvature of the bend to the channel

$T$  = channel top (water surface) width, ft

**Table 4-2.6(2) Open Conveyance Protection.**

Shear Stress at Design Flow (lb/ft <sup>2</sup> )				
Greater Than	Less Than or Equal To	Protection	Thickness	Min. Height Required Above Design Water Surface
0	2	Grass Lining <sup>1</sup>	N/A	0.5 ft.
0	2	Temporary Erosion Control Blanket <sup>5</sup>	N/A	0.5 ft.
2	4	Riprap <sup>1,2,4</sup>	1 ft.	2 ft.
3	6	Riprap <sup>3</sup>	2 ft.	2 ft.
4	8	Permanent Erosion Control Blankets and Turf Reinforcement <sup>5</sup>	NA	0.5 ft.
6	8	Slope mattress, gabion, etc.	Varies	1 ft.
10	20	Fabric formed or cast in place Concrete	Varies	1 ft.

1. Riprap shall be in accordance with Section 9-13.1 of the WSDOT/APWA standard specifications.
2. Riprap shall be a reasonably well graded assortment of rock with the following gradation:  
 Maximum stone size 12"  
 Median stone size 8"  
 Minimum stone size 2"
3. Riprap shall be reasonably well graded assortment of rock with the following gradation:  
 Maximum stone size 24"  
 Median stone size 16"  
 Minimum stone size 4"  
 Note: Riprap sizing governed by side slopes on channel, assumed ~3:1.
4. Bioengineered lining allowed for design flow up to 8 fps.
5. Provide Manufacturer's certification of blanket product's allowable shear strength.

**4-2.6(2) ROCK-LINING**

In rock-lined channels, stone (riprap) is placed on the channel side and bottom to protect the underlying material from erosion. Proper riprap design requires the determination of the median size of stone, the thickness of the riprap layer, the gradation of stone sizes, and the selection of angular stone which will interlock when placed.

Research by the U.S. Army Corps of Engineers has provided criteria for selecting the median stone size, <sup>W</sup>50 (Figure 4-2.1). If the riprap is to be used in a highly turbulent zone, such as a culvert outfall, downstream of a stilling basin, at sharp changes in channel geometry, etc., the median stone (<sup>W</sup>50) should be increased from 200 percent to 600 percent depending on the severity of the locally high turbulence. The thickness of riprap layer should generally be twice the median stone diameter (<sup>D</sup>50) or at least that of the maximum stone. The riprap should have a reasonably well graded assortment of stone sizes within the following gradation:

$$1.25^3 (D_{max}/D_{50})^3 \leq 1.50, (D_{15}/D_{50}) = 0.50, (D_{min}/D_{50}) = 0.25$$

**4-2.6(3) RIPRAP FILTERS**

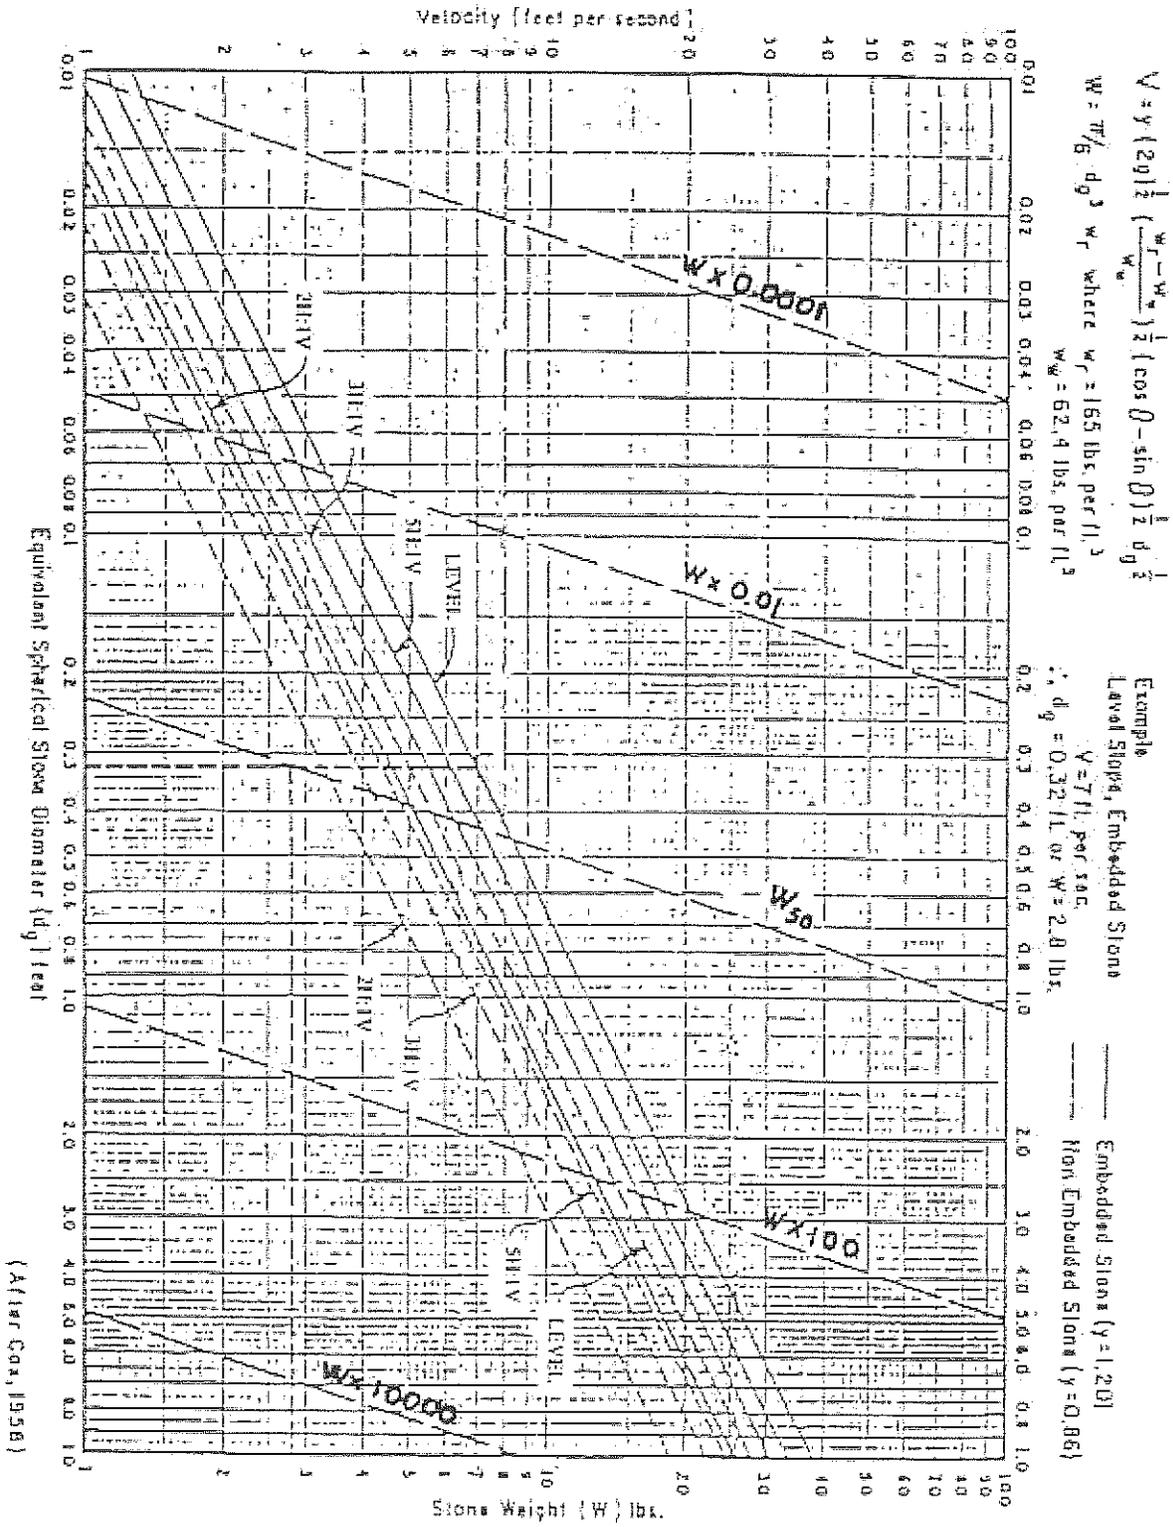

Riprap shall be underlain by a sand and gravel filter (or filter fabric) to keep the fine materials in the natural or artificial channel from being washed through the voids in the riprap. Likewise, the filter material shall be selected so that it is not washed through the voids in the riprap. Adequate filters can usually be provided by a reasonably well graded sand and gravel material with  $D_{15} < 5d_{85}$ , where d refers to the sieve opening through which 85 percent of the material being protected will pass and  $D_{15}$  has the same interpretation for the filter material. A filter with a  $D_{50}$  of 0.5 mm will protect any finer material

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

including clay. Where very large riprap is used it is sometimes necessary to use two filter layers between the material being protected and the riprap.

For additional information and procedures for specifying filters for riprap and general guidance, refer to the Army Corps of Engineers Manual EM 1110-2-1601 (1970) "Hydraulic Design of Flood Control Channels", paragraph 14, Riprap Protection.

Figure 4-2. 1 Median Stone Size Selection for Riprap Design.

#### 4-2.7 REQUIRED NOTES FOR STORM DRAINAGE PLANS

1. No part of the drainage system shall be covered, concealed, or put into use until it has been inspected, tested, and accepted by the City of Everett.
2. All work and material shall conform to the City of Everett Design and Construction Standards and specifications and the WSDOT/APWA Standard Specifications for Road, Bridge, and Municipal Construction (Current Edition).
3. Approximate locations of existing utilities have been obtained from available records and are shown from convenience. The contractor shall be responsible for verification of locations and to avoid damage to any additional utilities shown. If conflicts with existing utilities arise during construction, the contractor shall notify the Public Works Inspector and any changes required shall be approved by the City Engineer prior to commencement of related construction on the project.
4. All storm systems within the public right-of-way or in easements must be staked by survey for line and grade prior to starting construction.
5. All catch basin grates must be stenciled or stamped **“Dump No Waste, Drains to Stream, Lake, River, Puget Sound, or Wetland.”** Choose appropriate feature for the project

#### 4-3 STORMWATER ANALYSIS

##### 4-3.1 HYDROLOGIC ANALYSIS AND DESIGN STANDARDS

The minimum computational standards for designing stormwater systems depend on the type of information required and the size of the drainage area to be analyzed.

a calibrated continuous simulation hydrologic model based on the U.S. Environmental Protection Agency's (U.S. EPA) Hydrological Simulation Program-Fortran (HSPF) program, or an approved equivalent model (e.g., the Western Washington Hydrology Model [WWHM] or MGSFlood), must be used to calculate runoff and determine design flow rates and volumes for the purpose of designing stormwater facility BMPs in the City. Certain volume based BMPs may alternately be sized using the Soil Conservation Service Unit Hydrograph (SCSUH) or Santa Barbara Unit Hydrograph (SBUH) methodology as allowed in the Stormwater Management Manual.

For the purpose of designing conveyance systems in the City, the method depends upon the size of the basin. For sites in the City with a developed time of concentration less than or equal to 60 minutes, the rational method must be used to determine design flows. For sites in the City with a developed time of concentration of greater than 60 minutes, the designer must use an approved continuous simulation runoff model. The city also allows the use of dynamic hydraulic models such as the Storm Water Management Model (SWMM) available from the US EPA, and it's derivatives for basins of any size. Dynamic models must use a rainfall time series developed by the City of Everett unless otherwise approved by the City Engineer.

Table 4-3.1 summarizes the required standards for each type of stormwater analysis. Each analysis method is described in more detail in the following sections. See Section 4-2 for requirements for hydraulic analysis including pipe capacity and channel erosion calculations.

Table 4-3.1 Summary of Stormwater Analysis Standards

Application	Applicable Design Methodology
Flow Control Facility Sizing	Continuous Runoff Model (WWHM, MGSFlood, or approved equal)
Water Quality Facility Design	Continuous Runoff Model (WWHM, MGSFlood, or approved equal). Single Event Modeling may be used in limited circumstances as allowed in the Surface Water Manual
Onsite Stormwater Management/Low Impact Development Facility Design	Continuous Runoff Model (WWHM, MGSFlood, or approved equal)
Conveyance System Design (time of concentration less than 1 hour)	Rational Method or dynamic modeling using the 14 Storm Series
Conveyance System Design (time of concentration greater than 1 hour)	Continuous Runoff Model (WWHM, MGSFlood, or approved equal) or dynamic modeling using the 14 Storm Series

#### 4-3.1 (1) RATIONAL METHOD

The formula for the rational method is as follows:

$$Q = C i A$$

where:

Q = runoff in cubic feet per second

C = runoff coefficient (unitless)

i = average rainfall intensity, in inches per hour, for a particular storm duration

A = drainage area in acres

The rainfall intensity is found using the following equation, with contributing basin's time of concentration used as the storm duration:

$$i = m/T_c^n$$

where

T<sub>c</sub> = time of concentration

m,n = dimensionless coefficients (see Table 4-3.1(1)-1)

**Table 4-3.1(1)-1 Rainfall Coefficients**

coefficient	Mean Recurrence Interval (MRI)					
	2 yr	5 yr	10 yr	25 yr	50 yr	100 yr
m	3.69	5.20	6.31	7.83	8.96	10.07
n	0.556	0.570	0.575	0.582	0.585	0.586

The runoff coefficient represents the portion of rainfall that becomes runoff. Table 4-3.1(1)-2

gives runoff coefficient values to be used for storm conveyance calculations in the City of Everett.

**Table 4-3.1(1)-2**

GENERAL LAND COVER			
LAND COVER	C	LAND COVER	C
Dense Forest	0.10	Playgrounds	0.30
Light Forest	0.15	Gravel Areas	0.80
Pasture	0.20	Pavement and Roofs	0.90
Lawns	0.25	Open Water	1.00
SINGLE FAMILY RESIDENTIAL AREAS (Density is in dwelling units per gross acre)			
DENSITY	C	DENSITY	C
0.20	0.17	3.00	0.42
0.40	0.20	3.50	0.45
0.80	0.27	4.00	0.48
1.00	0.30	4.50	0.51
1.50	0.33	5.00	0.54
2.00	0.36	5.50	0.57
2.50	0.39	6.00	0.60

**4-3.1 (2) CONTINUOUS RUNOFF MODELS**

Ecology has developed the HSPF-based WWHM, which has been created for the specific purpose of sizing stormwater control facilities for new developments and redevelopments in western Washington. The WWHM can be used for a range of conditions and developments; however, certain limitations are inherent in this software. A detailed description for the use of WWHM can be found in Chapter 2 of Volume 3 of the Stormwater Management Manual.

One other HSPF-based continuous runoff model that has been approved by Ecology and may be used in the City is MGSFlood:

<http://www.mgsengr.com/mgsfloodhome2.html>

Use of other continuous simulation runoff models must receive prior concurrence from the City before being used for facility design.

All stormwater facilities including Flow Control, Water Quality Treatment and Onsite Stormwater Management BMPs must be designed using an approved continuous runoff model.

Conveyance systems designed using continuous runoff models must be designed using a maximum 15 minute time-step to determine peak flow rates.

#### **4-3.1 (3) DYNAMIC HYDRAULIC MODELS**

Dynamic hydraulic models allow the designer to account for the storage within a conveyance system and more accurately represent the function of some conveyance systems versus an analysis performed using the rational method. However, the use of dynamic models requires substantial computational resources and an experienced stormwater modeler to complete a design. As such it is expected that the approach will generally only be used on larger projects and more complex designs. There are many dynamic modeling software packages available, both in the public domain and for purchase. The City will accept the EPA's SWMM model and its proprietary derivatives as approved for use. Other software packages will be reviewed and approved on a case by case basis.

The City has prepared a rainfall record which shall be used for all dynamic modeling. The record is derived from calibrated rainfall data from 24 years of rainfall monitoring and is highly specific to the City of Everett. The record consists of the 14 storm events most likely to cause failure in a conveyance system. The data is provided in 5-minute increments in order to capture the high intensity-short duration storm events which are often responsible for conveyance system failure. A conveyance analysis which demonstrates that runoff from the entire 14 storm record can be routed without overtopping is equivalent to meeting the 25 year conveyance standard defined in section 4-2.

The 14-storm record is available upon request from the City of Everett Public Works Department as a text file suitable for import into most dynamic modeling software.

#### **4-3.1 (4) SINGLE EVENT HYDROLOGY METHOD**

Single Event Hydrology is usable as an alternate method for designing some stormwater BMPs (wetpool type) as allowed in the Stormwater Management Manual. In addition it is useful for some other types of analysis where no minimum computation standards apply, such as preliminary analysis and concept generation. Two examples of single-event hydrograph methodology are the Soil Conservation Service Unit Hydrograph (SCSUH) and the Santa Barbara Unit Hydrograph (SBUH). These methods are discussed in Volume III, Section 2.3 of the Stormwater Management Manual, which should be used as a basis for designing using the single event hydrology method. However, there are two adjustments to the information contained in the Stormwater Management Manual when the method is used in the City of Everett. The Hydrologic Soils Group classifications presented in Section 4-3.3 must be used in place of those contained in the Stormwater Management Manual. In addition, the total precipitation depths presented in Table 4-3.1D should be used in place of determining rainfall depths from the hyetographs published in the Stormwater Management Manual.

All storm event hydrograph methods require the input of a design storm hyetograph, which is a plot of rainfall depth versus time for a given design storm frequency and duration. The design storm hyetograph is constructed by multiplying a dimensionless hyetograph (which plots the percent of total rainfall depth versus time) by the total rainfall depth for the design storm. The design storm hyetograph to be used in the City of Everett is a SCS Type 1A rainfall distribution resolved to 10-minute time intervals. Table 5.4 gives the total precipitation for the 6 month, 2-year, 10-year, and 100-year, 24-hour duration storms in Everett:

**Table 4-3.1(D) Design Storm Hyetograph 24-hour Design Storm Totals**

<u>Return Frequency</u>	<u>Total Precipitation (inches)</u>
6 month	1.12
2 year	1.55
10 year	2.25
25 year	2.60
100 year	3.25

**4-3.2 TIME OF CONCENTRATION AND TRAVEL TIME**

The following discussion is based on the methods described in Chapter 3, SCS TR-55(5). The time of concentration ( $T_c$ ) is the time it takes for runoff to travel from the hydraulically most distant point of the watershed to the watershed outlet. The  $T_c$  is computed by summing all the travel times for consecutive components of the drainage conveyance system. The  $T_c$  influences the shape and peak of the runoff hydrograph. Urbanization usually decreases the  $T_c$ , which increases peak discharge.

Water moves through a watershed as sheet flow, shallow concentrated flow, open channel flow, or some combination of these types of flow. The type of flow that occurs is best determined by field inspection.

Travel time ( $T_t$ ) is the ratio of flow length to flow velocity:

$$T_t = L/(60V)$$

where:

$T_t$  = travel time (minutes)

$L$  = flow length (feet)

$V$  = average velocity (feet/sec)

60 = conversion factor from seconds to minutes

The  $T_c$  is the sum of  $T_t$  values for the various consecutive flow segments.

$$T_c = T_{t1} + T_{t2} + \dots T_{tm}$$

where:

$T_c$  = time of concentration (minutes) and

$m$  = number of flow segments

**Sheet Flow:** Sheet flow is flow over plane surfaces. It usually occurs in the headwater areas of streams. With sheet flow, the friction value  $n_s$  is used. The  $n_s$  values are for very shallow flow depths of about 0.1 foot and are only used for travel lengths up to 300 feet. Table 5.7 gives Manning's  $n_s$  values for sheet flow for various surface conditions.

Manning's kinematic solution is used to directly compute  $T_t$ :

$$T_t = 0.42(n_s L)^{0.8} / ((P_2)^{0.527} (S_o)^{0.4})$$

where:

$T_t$  = travel time (min),

$N_s$  = sheet flow Manning's effective roughness coefficient

$L$  = flow length (ft),

$P_2$  = 2-year, 24-hour rainfall (in), and

$S_o$  = slope of hydraulic grade line (land slope, ft/ft)

*Shallow Concentrated Flow:* After a maximum of 300 feet, sheet flow is assumed to become shallow concentrated flow. The average velocity for this flow can be calculated as a function of watercourse slope and type of channel. After computing the average velocity using the velocity equation below, the travel time ( $T_t$ ) for the shallow concentrated flow segment can be computed using the travel time equation described above.

*Velocity Equation:* The following equation is commonly used for computing average flow velocity, once it has measurable depth:

$$V = k(s_o)^{1/2}$$

where:

$V$  = velocity (ft/s)

$K$  = time of concentration velocity factor (ft/s)

$s_o$  = slope of flow path (ft/ft)

"k" is computed for various land covers and channel characteristics with assumptions made for hydraulic radius using the following rearrangement of Manning's equation:

$$k = (1.49(R)^{0.667})/n \quad (\text{See Table 4-3.2})$$

where:

$R$  = an assumed hydraulic radius

$n$  = Manning's roughness coefficient for open channel flow

**Table 4-3.2 "n" and "k" Values Used in Time Calculations for Hydrographs**

Sheet Flow (initial 300 feet of travel)	
Surface	n
Smooth surfaces (concrete, asphalt, gravel, compacted soil)	0.011
Fallow fields or loose soil	0.05
Short prairie grass and lawns	0.17
Dense grasses	0.15
Bermuda grass	0.24
Range (natural)	0.41
Woods or forest with light underbrush	0.13
Woods or forest with dense underbrush	0.40
Shallow Concentrated Flow (After the initial 300 feet of sheet flow; R = 0.1)	
Surface	k
Forest with heavy ground litter and meadows (n = 0.10)	3
Brushy ground with some trees (n = 0.060)	5
Fallow or minimum tillage cultivation (n = 0.040)	8
High grass (n = 0.035)	9
Short grass, pasture and lawns (n = 0.030)	11
Nearly bare ground (n = 0.25)	13
Paved and gravel areas (n = 0.012)	27
Intermittent Channel Flow (At the beginning of visible channels, R = 0.2)	
Channel Type	k
Forested swale with heavy ground litter (n = 0.10)	5
Forested drainage course/ravine with defined channel bed (n = 0.050)	10
Rock-lined waterway (n = 0.035)	15
Grassed waterway (n = 0.030)	17
Earth-lined waterway (n = 0.025)	20
CMP pipe (n = 0.024)	21
Concrete pipe (n = 0.012)	42
Other waterways and pipe	0.508/n
Continuous Stream Channel Flow (R = 0.4)	
Channel Type	k
Meandering stream with some pools (n = 0.040)	20
Rock-lined stream (n = 0.035)	23
Grass-lined stream (n = 0.030)	27
Other streams, man-made channels, and pipe	0.807/n

*Open Channel Flow:* Open channels are assumed to begin where surveyed cross-sectional information has been obtained, where channels are visible on aerial photographs or in the field, or where lines indicating streams appear (in blue) on United States Geological Survey (USGS) quadrangle sheets. The  $k_c$  values from used in the velocity equation above or water surface profile information can be used to estimate average flow velocity. Average flow velocity is usually determined for bank full conditions. After average velocity is computed, the travel time ( $T_t$ ) for the channel segment can be computed using the travel time equation above.

*Lakes or Wetlands:* Sometimes it is necessary to estimate the velocity of flow through a lake or wetland at the outlet of a watershed. This travel time is normally very small and can be assumed to be zero. Where significant attenuation may occur due to storage effects, the flows should be routed using the “level pool routing” technique described in Chapter 5.4.4.

*Limitations:* The following limitations apply in estimating travel time ( $T_t$ ).

1. Manning’s kinematic solution not be used for sheet flow longer than 300 feet.
2. In watersheds with storm drains, the appropriate hydraulic flow path must be carefully identified to estimate  $T_c$ . Storm sewers generally handle only a small portion of a large event. The rest of the peak flow travels to the outlet by streets, lawns, etc.
3. A culvert or bridge can act as a reservoir outlet if there is significant storage behind it. Other methods should be applied to determine the outflow from a reservoir.

### 4-3.3 SOILS

The Soil Conservation Service (SCS) classified over 4,000 soil types into four soil groups based on runoff potential. The soil groups are used as part of storm event hydrograph analysis methods. The continuous simulation hydrology methods contained in the Stormwater Management Manual further reduce the soil groupings into three categories: Outwash, Till and Saturated soils. While soil type classifications are published by the SCS and in the Stormwater Management Manual experience has shown that some soil types encountered within the City of Everett respond differently than their common classifications. Hydrologic analysis conducted within the City are to be designed using the soil classes contained in Table 4-3.1C.

**Table 4-3.3 Hydrologic Groups (HG) for Soils in the City of Everett**

<u>Soil Type</u>	<u>HG</u>	<u>WWHM</u> <u>Soil Type</u>	<u>Soil Type</u>	<u>HG</u>	<u>WWHM</u> <u>Soil Type</u>
Alderwood	C	Till	Mukilteo	D	Till
Bellingham	C	Till	Norma	D	Till
Cathcart	C	Till	Pastik	C	Till
Custer	C	Till	Puget	C	Till
Everett	A	Outwash	Puyallup	B	Outwash
Indianola	A	Outwash	Snohomish	D	Till
Kitsap	C	Till	Sumus	C	Till
Lynnwood	A	Outwash	Tokul	C	Till
McKenna	D	Till	Winston	A	Outwash

#### 4-3.4 INFILTRATION RATE DETERMINATION

Stormwater infiltration can be used to address minimum requirements #5, 6, and 7 of the Stormwater Management Manual. The site assessment and design approach for infiltration facilities is based primarily on the approach outlined in the following sections of the SWMM:

1. Volume III, Section 3.3: Infiltration Facilities for Flow Control and Treatment
2. Volume V, Chapter 5: On-Site Stormwater Management
3. Volume V, Chapter 7: Infiltration and Bioretention Treatment Facilities.

The City has modified these methods based on an understanding of the specific geology and soil conditions present within the city. Infiltration rates and feasibility shall be designed in accordance with the Stormwater Management Manual, except as specified below. Where the Stormwater Management Manual and these standards conflict the standards below shall take precedence.

The level of infiltration site assessment depends on the size of the project, depth to groundwater, and the potential risk of flooding and property damage if the facility fails or is undersized. For projects that trigger Minimum Requirements #1-5 only and meet certain criteria, the level of assessment is relatively simple and may be accomplished without a licensed professional. For projects that trigger Minimum Requirement #1-9, the level of assessment is more detailed and shall be conducted by a professional engineer with geotechnical expertise, a licensed geologist, an engineering geologist, or a hydrogeologist licensed in the State of Washington (referred to below as a “qualified professional”). Additional groundwater mounding evaluation is required for those sites that may be impacted by groundwater mounding.

##### 4-3.4(1) DETERMINATION OF REQUIRED ANALYSIS METHOD

The level of infiltration analysis required is based on the proposed BMPs, the size of the project, the potential for failure due to groundwater mounding, and the potential impacts due to failure of the facility. The sections below outline the criteria to be used when determining whether a project is subject to the downspout full infiltration analysis, the simplified analysis or the detailed analysis. In all cases, the chosen method of analysis shall be approved by the City.

For evaluation of downspout full infiltration, the applicant shall follow the procedures outlined in Section 3.1 Volume III of the Stormwater Management Manual.

For sites that are only subject to Minimum Requirement#1-5, the simplified analysis (Step 4b) may be used for rain gardens and permeable pavement as long as the following conditions are met:

- The site is at least 20 feet higher in elevation than nearby streams, lakes, wetlands, documented seepage, or other indications of shallow groundwater,
- Nearby infiltration facilities have not failed or underperformed,
- There is a low risk of flooding and property damage in the event of clogging or other failure of the infiltration system, and
- For permeable pavement, the permeable pavement facility will only manage runoff from its own footprint, and will not receive stormwater run-on from any other surfaces.

The detailed analysis is required for any Minimum Requirement #1-5 site that does not meet all the criteria for the simplified analysis. In addition, the City may require that the detailed method of analysis be conducted based on review of results from the simplified analysis. The detailed analysis includes more

intensive field testing and soils investigation to evaluate subsurface conditions and shall be conducted by a qualified professional.

All sites subject to Minimum Requirement#1-9 shall utilize the detailed analysis.

#### **4-3.4 (2) DOWNSPOUT FULL INFILTRATION ANALYSIS**

For evaluation of downspout full infiltration, the applicant shall follow the procedures outlined in Section 3.1 Volume III of the Stormwater Management Manual.

#### **4-3.4(3) SIMPLIFIED ANALYSIS**

The simplified analysis does not need to be conducted by a qualified professional, although a basic level of technical expertise is recommended to properly implement the analysis and interpret and utilize the results for design application. The simplified analysis includes the following three steps.

##### **4-3.4(3)A CONDUCT SUBSURFACE EXPLORATIONS AND COLLECT SOIL SAMPLES**

The simplified analysis includes the following site characterization activities:

- Conduct at least one subsurface exploration in potential locations for the infiltration facility. These explorations shall extend at least one foot below the bottom of the proposed facility. Explorations may be hand dug (if feasible) or excavated using equipment. To the extent feasible, explorations shall be conducted during the middle to end of the wet season (December 1 through April 30) to provide wet-season groundwater information.
- Collect Representative samples from each soil type encountered below the proposed base of the infiltration facility.
- Conduct grain-size analysis (ASTM D422 or equivalent AASHTO specification) on each soil sample.

##### **4-3.4(3)B DETERMINE THE DESIGN INFILTRATION RATE**

Applicants using the simplified analysis may either use the grain size method described below or the PIT method described in the detailed analysis. The grain size method does not account for all factors that influence infiltration rates and is considered less reliable than the PIT methods.

The Soil Grain Size Analysis method detailed in Sections 3.3.6 and 3.3.8 of the Stormwater Management Manual will not be accepted in the City of Everett. This is because this method is only applicable to non-glacially consolidated soils, while most soils within the City have been subject to glacial consolidation. The grain size method described below provides more conservative infiltration rates to account for the effects of glacial consolidation.

To use the grainsize analysis method, soil samples shall be collected from soil layers beneath the bottom of the proposed facility. The soil samples shall be tested by a qualified soils lab in accordance with the Unified Soil Classification System (USCS) test procedure (ASTM D422) with a mathematical correction to remove the soil particles retained on the #10 (2 millimeter) Standard Sieve. The mathematical correction is conducted by multiplying the percent passing the #200 sieve (0.075 millimeters) by the percent passing the #10 sieve.

Table 4-3.4 provides the correlation between the corrected percentage of soil passing the #200 sieve and the recommended design infiltration rates. The recommended design infiltration rates are conservatively low to account for the following factors:

1. Limitations of all grain size approaches for estimating infiltration rate,
2. Most soils in Everett are glacially consolidated.,
3. The potential for low-permeability layers or groundwater mounding beneath the facility,
4. Site variability, and
5. Long-term clogging due to potential siltation in the infiltration facility.

**Table 4-3.4 Recommended Infiltration Rates Based on Corrected Silt Content**

<b>USDA Textural Classification</b>	<b>USCS Classification</b>	<b>Corrected Silt Content (% passing the #200 sieve)*</b>	<b>Design Infiltration Rate (in./hr)</b>
Clean Sand and Gravel	Trace to slightly silty SAND	15%	1
Loamy Sand	Silty SAND	15 – 30%	0.5
Sandy Loam	Very silty SAND	30 – 50%	0.3
Loam	Sandy SILT	>50%	Not suitable for infiltration

USDA – United States Department of Agriculture

USCS – United Soil Classification System

\*Silt content is corrected to only consider material passing the #10 sieve, as discussed in the text.

If more than one soil unit is encountered within 5 feet of the base of the facility, use the lowest infiltration rate determined from each of the soil units as the representative site infiltration rate.

If soil mottling, fine silt or clay layers, which cannot be fully represented in the soil gradation tests, are present below the bottom of the infiltration pond, the infiltration rates provided in the tables will be too high and the applicant may be required to conduct a Pilot Infiltration Test (Method 2).

#### **4-3.4(4) DETAILED INFILTRATION ANALYSIS**

The detailed analysis shall be conducted by a qualified professional. The following three steps are required for all proposed infiltration projects that require detailed infiltration analysis.

#### **4-3.4(4) A CONDUCT SUBSURFACE EXPLORATIONS AND COLLECT SOIL SAMPLES**

The detailed analysis includes the following site characterization activities:

- Conduct subsurface explorations (either test pits or borings) in potential locations for the infiltration facility. To the extent possible, explorations shall be conducted during the middle to end of the wet season (December 1 through April 30) to provide wet-season groundwater information.
- Explorations shall extend deep enough to document the range of soil and groundwater conditions that might affect performance of the facility. The following recommendations shall be considered based on the drainage area tributary to each infiltration facility:
  - For drainage areas less than 1 acre tributary to an individual facility, the explorations shall extend at least 15 feet below the base of the proposed facility.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

- For drainage areas between 1 and 10 acres tributary to an individual facility, the explorations shall extend at least 30 feet below the base of the proposed facility,
- For drainage areas greater than 10 acres tributary to an individual facility, the explorations shall extend at least 50 feet below the base of the proposed facility.
- If the explorations encountered groundwater, monitoring wells shall be installed in the explorations and groundwater elevations shall be monitored during winter and early spring.
- Representative samples shall be collected from each soil type encountered below the proposed base of the infiltration facility.
- Prepare detailed logs for each exploration and a map showing the location of the explorations. Logs shall include the depth, soil descriptions, an estimate of soil density, depth to groundwater, and evidence of seasonal high groundwater elevation.
- There shall be at least one exploration per infiltration facility. For infiltration facilities that exceed 5,000 square feet in infiltration facility surface area, there shall be at least one exploration per every 5,000 square feet of infiltrating surface area. For linear infiltration facilities, there shall be at least one exploration per 200 feet of facility length.
- Conduct grain-size analysis (ASTM D422 or equivalent AASHTO specification) on at least one representative sample from each distinct soil type.

The depth and number of explorations and wells may be modified where demonstrated to be appropriate by the qualified professional and where approved by the City. Factors that may be considered include the variability of conditions across the site, knowledge from nearby sites, performance of nearby infiltration facilities, and risk of flooding and property damage in the event of failure of the infiltration system.

### **4-3.4(4) B DETERMINE THE DESIGN INFILTRATION RATE**

Infiltration rates for the Detailed Infiltration Analysis shall be determined using the large or small Pilot Infiltration Test (PIT) methods as described in Section 3.3.6 of the Stormwater Management Manual. Small-scale infiltration tests such as the EPA Falling Head or double ring infiltrometer test (ASTM D3385-88) are not allowed unless modified versions are determined to be acceptable by the Public Works Director. These small-scale infiltration tests tend to significantly overestimate infiltration rates and are generally considered unsuitable for design purposes.

The large PIT method will provide a more reliable estimate of the infiltration rate than the small PIT, but may be difficult to perform in tight spaces or with a limited supply of water. The small PIT method is conducted in an excavation with a bottom area of 12 to 36 square feet, while the large PIT method is conducted in an excavation with a bottom area of approximately 100 square feet.

The infiltration rate obtained from the PIT test shall be considered a short-term rate. This short-term rate shall be reduced through correction factors to account for uncertainty in the test method, site variability, and other factors. Corrections factors for estimating design infiltration rates based on PIT results are provided in Sections 3.3.6 and 3.4 in Volume III of the Stormwater Management Manual.

If the PIT test provides a measured (short-term) rate less than 0.3 inches/hour, stormwater infiltration is considered infeasible, and further assessment of infiltration feasibility is not required.

### **4-3.4(4) C GROUNDWATER MOUNDING ASSESSMENT**

A groundwater mounding analysis is required if any of the following conditions are encountered:

- If the drainage area to the facility is less than 1 acre and groundwater is within 10 feet of the base of the proposed facility.
- If the drainage area is between 1 and 10 acres and groundwater is within 25 feet of the base of the proposed facility,

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

- If the drainage area is greater than 10 acres and groundwater is within 45 feet of the base of the proposed facility.

In addition to the detailed analysis requirements outlined in Step 4c, projects subject to the groundwater mounding assessment shall include additional subsurface characterization and, if necessary, groundwater mounding modeling. The primary purpose of the groundwater mounding analysis is to determine if shallow groundwater or a perching layer will impact the performance of the facility. Minimum requirements for the groundwater mounding analysis are:

- The groundwater mounding analysis shall be conducted by a qualified professional, experienced in groundwater mounding assessment for stormwater infiltration projects.
- Installation of enough groundwater monitoring wells to characterize groundwater elevations beneath the site. One well may be sufficient for a single facility less than 10,000 square feet in area. Numerous wells may be necessary to characterize groundwater elevations for a large facility or numerous smaller facilities located across the site.
- Seasonal groundwater levels shall be monitored at the site during at least one wet season (December 1 through April 30). If there is no groundwater observed on the perching layer when the well is drilled, the well shall be completed just above the perching layer.
- A slug test, pumping test, or equivalent test shall be conducted in each installed monitoring well to estimate the transmissivity of the aquifer.
- Unless a qualified professional can provide sufficient justification that groundwater modeling is not warranted, groundwater modeling shall be conducted to evaluate potential impacts of groundwater mounding on facility performance.
- An assessment of potential groundwater impacts shall be conducted based on the results of the ground water mounding analysis. This assessment shall include a review of downgradient features, both onsite and offsite, that may be impacted by groundwater flow, including, but not limited to, steep slopes, wetlands, utilities, retaining walls, and other constructed facilities.

Additional analysis may be required for larger facilities as determined by the qualified professional or required by the City.

### 4-3.4(5) VERIFICATION OF PERFORMANCE

The engineer or designee shall inspect infiltration facilities before, during, and after construction as necessary to ensure facilities are built to design specifications, that proper procedures are employed in construction, that the infiltration surface is not compacted, and that protection from sedimentation is in place.

In addition, full-scale infiltration tests shall be performed for all infiltration facilities that are designed to meet Minimum Requirement #6 – Runoff Treatment or Minimum Requirement #7 – Flow Control. Where BMP acceptance testing procedures are provided in the Stormwater Management Manual, those procedures shall be used. Where BMP acceptance testing procedures are not provided in the Stormwater Management Manual, the following procedure may be used:

1. Add clean water to the facility in a manner that minimizes erosion and disruption of the exposed soils,
2. Flood the entire bottom of the facility if it is a shallow infiltration pond or swale,
3. If the facility is a vertical drain or trench, fill the facility to the maximum design depth,
4. The water level shall not exceed the maximum operating depth in the facility,
5. Maintain a constant depth of water in the facility and measure the flow rate into the facility,

6. Continue the test until a steady state condition is achieved (i.e., the depth of water remains constant given a constant rate of flow) for a minimum of one hour,
7. The flow rate into the facility at steady state shall be less than 80% of the design capacity.
8. If the design capacity for the facility is greater than 150 gallons per minute the applicant may proposed an alternative acceptance testing procedure.

Unless otherwise directed in the Stormwater Management Manual, full-scale infiltration testing shall be conducted after excavation of the facility to its final depth and before placement of the bioretention soil, gravel backfill, or other protective layer. If the observed infiltration rate is less than the design rate, notify the City inspector to determine whether facility enlargement or modification may be required.

#### **4-4 STORMWATER FACILITIES**

##### **4-4.1 GENERAL STORMWATER FACILITY REQUIREMENTS**

Stormwater facilities constructed in the City shall be designed, constructed, and maintained in accordance with the requirements of the Stormwater Management Manual. In addition, the facilities shall comply with the following requirements:

###### **4-4.1 (1) OWNERSHIP**

The City of Everett assumes ownership and maintenance of facilities designed and constructed for single family residential projects. However, all other facilities (for multi-family, commercial, or industrial projects) remain privately owned and operated.

The City of Everett will not generally accept ownership of some types of BMPs without prior approval by the city. BMPs that require prior approval include:

- Detention Tanks or Pipes constructed from steel pipe materials
- Sand Filter Vaults or Devices
- Media Filtration Devices
- Rain Gardens and small site bio-retention facilities.

###### **4-4.1 (2) PROJECTS WITH PUBLIC MAINTENANCE OF THE STORMWATER FACILITIES**

Storm facilities in rights-of-way, public easements, and those associated with residential subdivisions or any other development where the City will undertake maintenance of the facility may have special restrictions regarding materials used and/or design criteria for open-air systems. Specific restrictions/criteria applying to this type of development include, but may not be limited to, the following:

1. Corrugated metal pipe may not be used in storm drainage systems, including detention pipes and wet tanks, unless otherwise approved by the City Engineer.
2. All stormwater detention and deep dead storage (deeper than 2.5 feet) shall be provided in underground, covered systems unless otherwise approved by the City Engineer. Only shallow vegetated storage, infiltration basins, bioretention facilities and sand filter basins shall generally be allowed as open-air systems. Retaining walls associated with these open-air facilities shall not exceed three feet in height and side slopes shall not exceed 3:1 (H:V).
3. Open-air stormwater facilities (such as wetponds, infiltration basins, and sand filter basins) providing runoff control for residential subdivisions or any other development where the City will undertake maintenance of the facilities shall be dedicated in a separate tract to the City of Everett.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

The tract dedicated shall include, at a minimum, all area within the high water mark, and may be required to include any required access roads or paths associated with the facilities.

4. The City may require an area 10 feet wide, as measured from the high water mark, to be provided around the perimeter of an open-air runoff control facility and included in a tract held in common ownership, with an easement granted to the City. The City strongly encourages landscaping of this area by the developer to provide screening for the pond and an aesthetically pleasing appearance. Maintenance and irrigation of the landscaping shall be provided as necessary to ensure successful plant establishment.
5. At a minimum, an area five feet wide must be available to the City for maintenance of any fencing associated with stormwater management facilities. This area must be provided around the perimeter of the fence, on both sides. If this area is not contained within the dedicated drainage tract, then an easement must be granted to the City.
6. The developer shall establish appropriate vegetation in the entire dedicated right-of-way. Vegetation shall be selected which will not inhibit the function or maintenance of the stormwater facility.

### 4-4.1 (3) SETBACKS

1. All wet pool, detention and infiltrating facilities shall maintain minimum setback distances as follows. All setbacks shall be horizontal unless otherwise specified:
  - a. 1 foot positive vertical clearance from any open water maximum surface elevation to structures within 25 feet.
  - b. 10 feet from the open water maximum surface elevation or edge of the stormwater facility to property lines and on-site structures.
  - c. 50 feet from top of slopes greater than 20 percent and greater than 10 feet high. A geotechnical analysis and report must be prepared addressing the potential impact of the facility on the slope. The geotechnical report may recommend a reduced setback, but in no case shall the setback be less than the vertical height of the slope.
  - d. 10 feet from open water maximum surface elevation or edge of stormwater facility to a sanitary sewer main or service.
  - e. 50 feet from any septic tank, holding tank, containment vessel, pump chamber, and distribution box.
2. Infiltrating facilities, including permeable pavement and bio-infiltration facilities, and unlined wetponds and detention ponds shall maintain the following additional setbacks:
  - a. 100 feet from the edge of a septic tank, drain field and drain field reserve area.
  - b. 100 feet from drinking water wells and 200 feet from springs used for public drinking water supplies. Infiltration facilities up-gradient of drinking water supplies and within 1, 5, and 10-year time of travel zones must comply with Health Department requirements (Washington Wellhead Protection Program, DOH, 12/93).
  - c. 100 feet from slopes greater than 20 percent and greater than 10 feet in height.
  - d. 300 feet from a landslide hazard area.
  - e. 10 feet from any other infiltration facility
  - f. 5 feet from a building without a basement and/or 10 feet from a building with a basement.
  - g. Additional requirements for infiltration facilities are contained in the Stormwater Management Manual and Section 4-3.4.
3. All underground stormwater facilities shall be setback from any structure or property line a distance equal to the depth of the ground disturbed in setting the structure.
4. A geotechnical analysis and report must be prepared for work located within 300 feet of the top of landslide or erosion hazard areas (as defined in Title 19, Chapter 37 of the Everett Municipal

Code). The scope of the geotechnical report shall include an assessment of impoundment seepage on the stability of the hazard area.

5. The City Engineer may increase the setbacks based on concerns about site specific soil conditions and proposed construction.

#### **4-4.1 (4) SITES CONTAINING OR ADJACENT TO CRITICAL AREAS**

Environmentally sensitive areas shall be protected and impacts mitigated in accordance with the City's Zoning Code requirements, the Stormwater Management Manual, and the conditions of final SEPA approval.

#### **4-4.2 STORMWATER FACILITY ACCESS**

Adequate access for maintenance and operation activities must be provided for all stormwater facilities constructed in the City. Access should be designed in accordance with the Stormwater Manual, except as modified below.

##### **4-4.2 (1) GENERAL ACCESS REQUIREMENTS**

1. An access road is required to all stormwater facility inlet pipes, control structures, risers and at least one point of each cell or compartment of a stormwater facility.
2. Access roads shall have a minimum width of 15 feet throughout.
3. Access roads shall have an all-weather surface of crushed rock or better.
4. Manhole and catch basin lids must be in, or at the edge of, the access road and at least 5 feet from a property line.
5. When the length of an access road exceeds 75 feet, a vehicle turn-around must be provided, and designed to accommodate vehicles having a maximum length of 31 feet and having an inside wheel path radius of 40 feet. The vehicle turn around requirement may be waived if a completely paved perimeter road is provided and can be used in a continuous drive back to the entrance with no turnarounds.
6. Stormwater facility access roads shall be located in the same tract as facilities, when the facilities themselves are in tracts. When facilities are located in designated open space areas, access roads may be located in the designated open space also, provided that they are constructed so as to be aesthetically compatible with the open space use.

##### **4-4.2 (2) ACCESS TO OPEN AIR FACILITIES**

1. Vehicle access to open-air facilities shall be limited to maintenance and operation personnel.
2. Access roads in accordance with Standard Drawing 430 shall be provided to the bottom of all cells or compartments of open-air facilities unless all of the following conditions apply:
  - a. cell or compartment bottoms are accessible or reachable by track hoes from an access road along the side of the facility; and
  - b. a truck can be loaded without the truck accessing the bottom of the cell or compartment
  - c. no point in the bottom of the cell or compartment is more than 20 feet from the center of the access road.
3. Access road surfacing shall be extended across the entire length of the bottom of the cell when an access road is extended to the bottom of a cell.
4. An access ramp shall be provided to the bottom of all vertical walled ponds, regardless of size.
5. A perimeter access road may be required by the City for large open-air stormwater facilities in order to provide complete vehicular access to all points of the facility requiring regular maintenance.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

6. Perimeter roads may be 12 feet in width where the road is not accessing a structure or being used for a circular loop road in lieu of turn around.
7. A minimum of one locking access road gate shall be provided to fenced open-air facilities. Gates must meet WSDOT State Standard Plan L30.10 and may be 14, 16, 18, or 20 feet in width.
8. Access to unfenced open-air facilities shall be limited by removable bollards. Bollards shall consist of two fixed bollards on the outside of the access road and two removable bollards equally spaced between the fixed bollards (or all four removable if placed in the traveled way). Bollards shall be separated by a minimum of 4 feet clear and no more than 6 feet. Fixed bollards shall be set a minimum of 15 feet apart with removable bollards between. Add or remove bollards from the standard configuration to meet separation standards.
9. Access gates and bollards must be set 20 feet back from the property line when the access road is connecting to a road that is posted at 35 mph or greater.

### 4-4.2 (3) ACCESS TO UNDERGROUND FACILITIES (VAULTS AND TANKS)

Access to underground stormwater facilities shall be provided in accordance with the Stormwater Manual and the following criteria:

1. Access openings shall be provided over all inlet pipes and outlet structures. Pipe inlet and outlet structures shall be visible from the rim of the access opening.
2. Ladders and hand-holds shall be provided at the outlet structure and inlet pipes and as need to meet OSHA confined space requirements.
3. Access roads shall be provided to all access points to underground facilities. Access roads shall be as required for open air facilities, or better.

### 4-4.2 (4) STORMWATER FACILITY FENCING

Fencing shall be provided for stormwater facilities in accordance with the Stormwater Manual, except as modified below:

1. Surface ponds and infiltration basins with a maximum depth of three feet or less do not require fencing provided the maximum associated interior side slope of the pond does not exceed 3H:1V (including baffle side slopes).
2. All ponds and basins with a maximum design depth of water greater than three feet will require a six foot high perimeter fence unless one of the following conditions is met:
  - a. The facility is designed and constructed with a 10 foot wide safety bench for every three feet of depth, and no more than 10% of the interior side slopes are greater than 3H:1V (including baffle side slopes); or
  - b. The facility is designed and constructed so that the maximum water depth of the facility does not exceed three feet during a 2 year recurrence interval event, nor exceed three feet during a 25 year recurrence interval event, and no more than 10% of the interior side slopes exceed 3H:1V (including baffle side slopes); or
  - c. The City Council reviews a proposed facility designed and approved by a licensed engineer or architect which meets neither the requirements of a or b herein and exercising its discretion makes a policy determination that either no fencing will be required or fencing less than six feet in height will be required. Issues considered by the Council when making this determination include but are not limited to: (1) reasons why the proponent does not want to construct a fence six feet in height; (2) purpose(s) the facility is to serve; (3) design considerations of the facility; (4) safety considerations of the facility without the fencing or with fencing reduced in height; and (5) such additional issues as the Council feels are appropriate.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

3. When fencing is required around a facility to be dedicated to and/or maintained by the City, the fence shall be a chain link fence. The chain link fabric shall be galvanized steel core wire and, when the facility is in a visible location, shall be coated with bonded polyvinyl. The polyvinyl coating shall not be subject to fading, cracking, peeling, or shrinkage and shall be brown, black, or some shade of natural green (such as pine, forest, or olive). The fence manufacturer shall provide a 10 year (minimum) warranty on polyvinyl coating. All posts, cross bars, rails, fasteners, and gates shall be powder-coated the same color as the chain link fence fabric.
4. Fencing slats will be allowed, subject to the same color restrictions as the polyvinyl coating, if the slats proposed are non-brittle, crack-resistant, "locked in place" in a bottom retaining channel, and non-fading.
5. The chain link fence shall meet all other applicable specifications for Type I or Type 3 chain link fence as set forth in the most current edition of the Standard Specifications for Road, Bridge, and Municipal Construction (Washington State Department of Transportation, American Public Works Association), except that line posts for Type 3 fence shall be set in concrete.
6. Fencing of tracts within the clear zone of roads with design speeds of 35 mph or higher shall use WSDOT Type 3 chain link fence.
7. Other regulations such as the International Building Code (IBC) may require fencing of vertical walls.
8. For metal baluster fences, IBC standards apply.

### 4-4.2 (5) STORMWATER FACILITY MAINTENANCE REQUIREMENTS

1. Adequate provisions to facilitate maintenance operations must be included in the design of all stormwater facilities. Provisions must be made for regular and perpetual maintenance of the facility, including replacement and/or reconstruction of any media that are relied upon for treatment purposes. The maintenance checklists in Volume V, Section 4.6 of the Stormwater Manual and the Washington Department of Ecology's 2013 Western Washington Low Impact Development(LID) Operation and Maintenance (O&M) Guidance Document should be used to identify required maintenance for specific BMPS. Additional maintenance requirements may be imposed by the City.
2. Any standing water removed during maintenance operations must be disposed of to an approved discharge location. Discharge to a sanitary sewer at an approved discharge location may be an option. The City of Everett must be contacted prior to any discharge. Residuals must be disposed of in accordance with state and local solid waste regulations (see Minimum Functional Standards for Solid Waste Handling, Chapter 173-304 WAC).
3. The maintenance of drainage facilities associated with commercial, industrial, planned residential development, and multi-family development is the responsibility of the owner(s) of the development.
4. The City generally assumes the operation and maintenance of drainage facilities constructed in connection with residential subdivision of land in the City, after the expiration of a two-year operation and maintenance period, if the following conditions have been met:
  - a. All of the requirements of Section 14.28.090 of the Everett Municipal Code have been fully complied with; and
  - b. The facilities have been inspected and accepted by the utility division of the Public Works department after two years of operation and maintenance in accordance with City maintenance standards; and
  - c. All deeds conveying drainage tracts and necessary easements entitling the City to properly maintain the facilities have been conveyed to the City and recorded with the Snohomish County auditor; and
  - d. The warranty bond required in subsection D of Section 14.28.090 of the Everett Municipal Code has been extended for one year, covering the City's first year of operation and maintenance; and

- e. The developer has supplied to the City an accounting of capital construction, operation and maintenance expenses, or other items, for the drainage facilities to the end of the two-year period.

#### **4-4.3 ONSITE STORWATER MANAGEMENT AND LOW IMPACT DEVELOPMENT**

Projects subject to Minimum Requirement #5 shall implement onsite stormwater BMPs in accordance with the Stormwater Management Manual. Additional requirements and restrictions specific to the City are included in the following subsections. Where the Stormwater Management Manual requirements conflict with those below the standards herein shall take precedence.

Onsite stormwater management facilities which are also credited toward the requirements of Minimum Requirements #6 and #7 shall comply with the requirements for water quality treatment and flow control facilities in regards to the owner's responsibilities for maintenance and ongoing operation. The City shall retain the same rights to access and inspect onsite facilities used to meet other requirements as it would for water quality treatment flow control facilities. Documentation requirements, including asbuilt drawing requirements, will also be the same.

##### **4-4.3(1) APPLICABILITY AND INFEASIBILITY CRITERIA**

Onsite Stormwater Management BMPs shall be selected based on the selection methods outlined in Minimum Requirement #5 and the infeasibility criteria associated with each BMP. In order to facilitate selection of BMPs the City maintains an Infiltration Infeasibility Map identifying areas known to be incompatible with infiltration. Projects which fall within the areas identified as infeasible need not provide any other documentation that infiltration BMPs such as Rain Gardens, Bioretention and Permeable Pavements are infeasible. Refer to Section 4-3.4 for additional infeasibility criteria and requirements.

All projects subject to Minimum Requirement #5 must comply with BMP T5.13 – Post Construction Soil Quality and Depth, except where existing vegetation will be retained on steep slopes.

##### **4-4.3 (2) RAIN GARDENS**

Rain gardens are non-engineered, shallow, landscaped depressions with amended soils and adapted plants. Rain gardens may be used to meet onsite stormwater management requirements and in voluntary retrofit installations for residential and small commercial sites. Rain gardens shall be designed and constructed in accordance with Section 10.3 of Volume V of the Stormwater Management Manual, Standard Drawings 425 and 426, and the following criteria:

1. Rain gardens may not be constructed in areas indicated as infeasible in the Infiltration Infeasibility Map unless specifically approved by the City Engineer.
2. A rain garden information sign shall be placed in all new rain gardens associated with new construction, and is encouraged in retrofit and voluntary rain garden installations. Signs are available from the permit counter at a nominal expense.
3. A maintenance agreement shall be recorded for each new privately owned rain garden to ensure ongoing maintenance of by the property owner. Details of the maintenance agreement are available from Permit Services.
4. Mulch shall be applied to all rain gardens. Mulch below the design water surface shall consist of coarse compost in accordance with Section 9-14.4(8) of the WSDOT/APWA Standard

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Specifications. Mulch above the design water surface shall consist of mixture of 35%-50% bark or wood chips and 50% to 65% fine compost in accordance with Section 9-14.4(8) of the WSDOT/APWA Standard Specifications.

5. Rain gardens shall be planted with appropriate plant material for the location within the rain garden. Consult the Rain Garden Handbook for Western Washington (2013) for guidance on plant selection. Plantings shall comply with applicable city vegetation standards for plant types and maintenance.
6. Where permits require a landscape plan the rain garden plantings shall be incorporated into the site landscape plan.

### 4-4.3 (3) BIORETENTION

Bioretention facilities shall be designed in accordance with the requirements of the Stormwater Management manual. Bioretention facilities may be used to meet the requirements of Minimum requirements #5, #6, and #7 as defined in the Stormwater Management Manual.

1. Bioretention facilities may not be constructed in areas indicated as infeasible in the Infiltration Infeasibility Map unless specifically approved by the City Engineer, except that bioretention facilities with an impermeable liner may be used in most circumstances. Bioretention facilities with impermeable liners do not meet the requirements of Minimum Requirement #5, but may be applicable to Minimum Requirements #6 and #7 Lined bioretention facilities must meet the same steep slope setback requirements as lined facilities.
2. A maintenance agreement shall be recorded for each new privately owned bio-retention facility which serves a single lot or property to ensure ongoing maintenance of by the property owner. Details of the maintenance agreement are available form Permit Services.
3. A separate tract shall be provided for bioretention facilities which serve multiple lots or parcels.

### 4-4.3 (4) PERMEABLE PAVEMENT

Permeable Pavement shall be installed where required by Minimum Requirement #5. Permeable pavement may also be used meet the requirements of Minimum Requirement #6 and/or #7 when designed as outlined in the Stormwater Management Manual. In addition, permeable pavement installations shall meet the following criteria:

1. Permeable Pavement shall be constructed in accordance with Standard Drawings 431 and 432.
2. Permeable pavement installations in the public right of way shall be designed by a licensed civil engineer familiar with the design of permeable pavement and shall be designed using the process outlined in the AASHTO Guide for Design of Pavement Structures.
3. All materials and construction methods for permeable pavement shall comply with the most current APWA GSPs for permeable pavements. GSP's include the following:

Subgrade for Permeable Pavements	APWA GSP 2-06.3(3)
Subgrade for Permeable Pavements	APWA GSP 2-06.5
Permeable Ballast	APWA GSP 4-04.2 and 9-03.9(2)
Crushed Surfacing Chocker Course	APWA GSP 4-04.2 and 9-03.9 (2)
Aggregates for Permeable Base	APWA GSP 4-04.2 and 9-03.9(2)
Shaping and Compaction	APWA GSP 4-04.3(5)
Asphalt Treated Base (ATB)	APWA GSP 4.SA1
Asphalt Treated Permeable Base (ATPB)	
Aggregates for Porous Hot Mix Asphalt/	APWA GSP 4-SA2
Porous Warm Mix Asphalt (PHMA/PWMA)	APWA GSP 5-04.1 and 9-03.8

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Porous Asphalt Construction Requirements	APWA GSP 5-04.3
Porous Asphalt Mix Design	APWA GSP 5-04.3(7)
Porous Concrete	APWA GSP 5-04.3(8)
Spreading and Finishing Porous Concrete	APWA GSP 5-04.3(9)
General Porous Concrete Requirements	APWA GSP 5-04.3(10)
Pervious Concrete	
Aggregates for Asphalt Treated Base	APWA GSP 9-03.6

- Underdrains shall be provided at the lowest end of all permeable pavement installations in accordance with Standard Drawing 432. Underdrains shall be Perforated Corrugated Polyethylene Underdrain Pipe, 6 inch diameter minimum, in accordance with Section 9-05.2(7) of the WSDOT/APWA Standard Specifications. Underdrains shall be connected to a storm drainage system or day lighted in a manner which ensures that stormwater will not back up into the pavement base course material.
- When required, subgrade check dams shall be installed in accordance with Standard Drawing 432. Check dams shall extend the full span of the permeable pavement installation and tie into native soils in a manner which prevents short circuiting around the ends of the check dam.
- Where native soils do not meet the treatment soil suitability criteria a 6 inch layer of media shall be placed below pollution generating permeable pavement section. The media shall meet the soil suitability criteria or the sand filter specifications contained in the Stormwater Management Manual. The hydraulic conductivity of the filter layer shall exceed that of the native soils.
- Drainage collection systems in permeable pavement installations shall be designed as if conventional pavement is being used. Catch basins, or other appropriate collections methods, shall be placed at all low points and
- Permeable pavement installations shall be treated as stormwater facilities and shall be maintained per the requirements of the Stormwater Management Manual. Maintenance requirements shall be defined in the project stormwater site plan and shall be provided to the property owner in conjunction with other site maintenance documents.

### 4-4.4 FLOW CONTROL

Projects which are required to meet Minimum Requirement # 7 shall provide flow control facilities in full compliance with the requirements of the Surface Water Management Manual. Flow control BMP design is described in detail in the Stormwater Management Manual. Additional requirements for specific types of BMPs are included in the following subsections Where the Stormwater Management Manual requirements conflict with those below the standards herein shall take precedence.

In accordance with Section 14.28 of the City of Everett Municipal Code the threshold requirements contained in Section 2.5.7 of the Stormwater Management Manual are replaced with the following:

*The following circumstances require achievement of the standard flow control requirement for western Washington:*

- Projects in which the total of effective impervious surfaces is 5,000 square feet or more in a threshold discharge area, or*
- Projects that convert  $\frac{3}{4}$  acres or more of vegetation to lawn or landscape, or convert 2.5 acres or more of native vegetation to pasture in a threshold discharge area, and from which there is a surface discharge in a natural or man-made conveyance system from the site, or*
- Projects that through a combination of effective hard surfaces and converted vegetation areas cause a 0.15 cubic feet per second increase in the 100-year flow frequency from a threshold discharge area as estimated using the Western Washington Hydrology Model or other approved model using 15-minute time steps. The determination of the amount of increase in flow shall be*

*determined based on the site conditions at the time of application and the anticipated runoff at the completion of the proposed improvements.*

All other requirements of Section 2.5.7 of the Stormwater Management Manual are applied as given.

When downstream drainage courses are inadequate or systems are undersized, or when, in the opinion of the City, property or properties may be adversely affected by the existing and/or proposed stormwater release rates, additional stormwater flow control measures may be required. Such determination by the City may be based upon existing information indicating problem areas or based upon current or past litigation regarding drainage problems within the vicinity of the project. If additional stormwater flow control measures are required by the City, the applicant may have the option to correct and/or improve downstream drainage conditions so that the proposed stormwater release rate does not have to be further restricted. Any offsite improvements will require the applicant to obtain easements from the owners of any property where work is to take place.

#### **4-4.4 (1) DETENTION PONDS**

Detention ponds shall be designed in accordance with Section 3.2.2 of Volume III of the Stormwater Management Manual and Standard Drawing 430. Detention ponds shall also comply with the access requirements in Section 4-4.2(2) and the following requirements:

1. Drainage facilities should be made attractive features of the urban environment. To this end, engineers are encouraged to be creative in shaping and landscaping facilities and to consider aesthetics when choosing alternatives for parking lot paving, conveyance systems, detention facilities, weirs, structures, etc.
2. An overflow route must be identified for stormwater flows that overtop the facility when facility capacity is exceeded or the facility becomes plugged and fails. The overflow route must be able to convey the 100-year recurrence interval developed peak flow to the downstream conveyance system or other acceptable discharge point without posing a health or safety risk or causing property damage.
3. No trees may be planted on berms that impound water either permanently or temporarily during storms. This restriction does not apply to cut slopes that form pond banks, only to berms  
*Note: The internal berm in a wet pond is not subject to this planting restriction since the failure of an internal berm would be unlikely to create a safety problem.*

#### **4-4.4 (2) DETENTION TANKS**

Detention tanks shall be designed in accordance with Section 3.2.2 of Volume III of the Stormwater Management Manual and Standard Drawing 418, Detention tanks shall also comply with the following requirements. Where these requirements conflict with the Stormwater Management Manual the following shall take precedence:

1. Tanks larger than 48 inches in diameter may be connected to each adjoining structure with a short section (2-foot maximum length) of 48-inch minimum diameter pipe.
2. Tanks shall not be located under the travel way in public rights of way. For single-family plans and planned urban developments (PUDs), planned residential developments, or planning and development districts, detention tanks shall be located in separate tracts.
3. No steel pipe shall be used in tanks. Tank materials shall be constructed of materials indicated in Standard Drawing XX unless otherwise approved.
4. Tanks shall be designed to meet the structural requirements for overburden, vector truck loads, and where appropriate traffic loadings. At a minimum tank materials shall meet the requirements for storm sewer pipe in the current version of the WSDOT/APWA Standard Specifications. End

plates shall be of the same material as the tank pipe, but of an appropriate thickness to meet structural requirements.

#### 4-4.4 (3) DETENTION VAULTS

Detention vaults shall be designed in accordance with Section 3.2.3 of Volume III of the Stormwater Management Manual and shall also comply with the following requirements. Where these requirements conflict with the Stormwater Management Manual the following shall take precedence:

1. Vaults shall not be located under the travel way in public rights of way, unless approved by the City Engineer. For single-family plans and planned urban developments (PUDs), planned residential developments, or planning and development districts, detention tanks shall be located in separate tracts.
2. Vaults within a traveled way which exceed 20 feet in length along the direction of travel shall be designed to meet bridge structural standards in accordance with the current version of AASHTO LRFD Bridge Design Specifications. Vaults meeting these criteria shall be designed by a structural engineer licensed in the State of Washington.
3. Vaults may be designed as back-up systems if they are preceded by runoff treatment facilities designed in accordance with Volume V of the Stormwater Management Manual
4. Vault bottoms shall slope laterally a minimum of 5 percent from each side towards the center forming a broad "V" to facilitate sediment removal. More than one "V" may be used on wide vaults to minimize vault depths. Alternate slope configurations may be acceptable if they enhance maintenance. In all cases an access point must be provided at each end of the "V" to facilitate sediment removal.

The city may allow the vault bottom to be flat if removable panels are provided over the entire vault. Removable panels should be at grade, have stainless steel lifting eyes, and weigh no more than 5 tons per panel.

#### 4-4.5 RUNOFF TREATMENT

Projects which are required to meet Minimum Requirement # 6 shall provide runoff treatment BMPs in full compliance with the requirements of the Stormwater Management Manual. The selection and design of Water Quality Treatment BMPs is described in detail in the Stormwater Management Manual. Additional requirements specific to the City of Everett are included in the following subsections Where the Stormwater Management Manual requirements conflict with those below the standards herein shall take precedence.

##### 4-4.5 (1) TREATMENT BMP SELECTION

Runoff treatment BMPs shall be selected and designed in accordance with Volume V of the Stormwater Management Manual, Except that the following BMPs listed in the Stormwater Management Manual will not be accepted for use in the City of Everett:

##### **Treatment BMP's Not Accepted by the City of Everett**

- Basic Biofiltration Swale (BMP T9.10)
- Wet Biofiltration Swale (BMP T9.20)
- Continuous Inflow Biofiltration Swale (BMP T9.30)
- Wet vault (BMP T10.20) except as noted below
- Wet Tanks (No BMP # Designation)
- API type Oil Water Separators (BMP T11.10) for contributing areas less than 2 acres.

Wet vaults are generally not allowed for the primary treatment of runoff in the City - the only exception is single family residential subdivisions creating less than 10,000 square feet of effective impervious area. However, wet vaults may be used for sediment removal upstream of sediment sensitive treatment facilities, or as the first/presettling cell of a wet pond design.

Combined detention and wet vaults are allowed; see BMP 10.40.

If a wet vault/tank is designed to provide runoff treatment but not runoff quantity control, it must be located off-line from the primary conveyance/detention system. Flows above the peak flow for the water quality design storm must bypass the facility in a separate conveyance to the point of discharge. A mechanism should also be provided at the bypass point to isolate the facility for maintenance purposes.

#### **4-4.5 (2) EMERGING TECHNOLOGIES**

The City will accept stormwater treatment BMPs not included in the Stormwater Management Manual only if they have been reviewed and received a designation under the Washington Department of Ecology's Technology Assessment Protocol- Ecology (TAPE) program. Use of TAPE designated BMPs shall be accepted subject to the following conditions:

1. Technologies used to comply with Minimum Requirements associated with development must have a current General Use Level Designation (GULD) from Ecology
2. Technologies of any designation may be used on voluntary retrofit projects which are not required to meet Minimum Requirements 5 or 6. Treatment technologies which will be maintained by the City must be approved by the City's maintenance department prior to use.
3. BMPs must be designed and maintained in accordance with the TAPE designation documentation.
4. The City Engineer also has the authority to add additional requirements or conditions to these technologies, beyond those required by Ecology.

## SECTION 5 - WATER DISTRIBUTION

### 5-1 GENERAL

All construction of water mains and related appurtenances shall conform to these Standards, applicable American Water Works Association (AWWA) Specifications and applicable sections of Division 7 of the WSDOT/APWA Standard Specifications. The general requirements of AWWA and the WSDOT/APWA Standard Specifications shall apply unless they are inconsistent with any of the provisions of this particular section. Should inconsistencies occur, these Standards shall have precedence. All reference to standard specifications such as AWWA or WSDOT/APWA shall require the use of the latest edition.

Any public water system or any plumbing in a residential or nonresidential facility providing water for human consumption which is connected to a public water system shall be lead free. With respect to solders and flux, "lead free" shall mean no more than 0.2% lead. With respect to pipes and pipe fittings, "lead free" shall mean no more than 8% lead.

Water main extensions will be required when the property does not front on a water main or when the existing water main is not adequate to meet the minimum fire flow requirement. The new water main extension shall extend across the property full frontage and shall be extended through and to the limits of the property being developed for system circulation or future development as determined by the Public Works Department. The minimum size water main shall be determined by the Public Works Department and shall be at least 8" inches in diameter unless otherwise approved by the Public Works Director or his designee.

Water main extensions or replacements and/or new fire hydrant installations may also be required per the requirements of the City Fire Marshal. Fire hydrant installations are not allowed on water mains that do not meet the minimum fire flow requirements of the area. In a single family / duplex neighborhood, the fire flow in the main must be a minimum of 1000 gpm before the installation of a fire hydrant is allowed.

A fire hydrant is required within 350 feet of every structure for single family homes and duplexes as well as new subdivisions and short subdivision for single family homes and duplexes.

For all other buildings from triplexes to commercial uses, a fire hydrant is required within 200 feet, but not closer than 50 feet to any structure (measured distance to be along route to be traveled by fire equipment).

Water meters are required for all new services including domestic, irrigation and fire services.

Unless finish grade information is provided to the water service construction crew prior to the installation, the property owner/applicant will be responsible for and may be charged for any necessary adjustments.

After the installation of any water service by the Public Works Department, the property owner shall be held responsible for, and may be charged for, any and all damages to the service line, meter setter, meter and meter boxes/vault or any other appurtenances until completion of construction and/or the structure is approved for occupancy.

All water mains on private property that are looped back to the public right-of-way or are open to the general public system shall be installed in easements, granted to the City, and shall be maintained by the City. (See Section 5-8.6 for main looping requirements.)

The minimum water main easement width shall be 15 feet, 5 feet on one side and 10 feet on the other side and shall be exclusive for the water main and appurtenances. The legal description shall be prepared by a

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Surveyor licensed to practice in the State of Washington. The easement shall be reviewed and approved by the Public Works Director or his designee prior to acceptance.

Due to the complexities of many water mains and their interface with other underground structures, all water main construction shall be staked to ensure placement within designated easements. Any deviation from this requirement must be approved by the Public Works Director or his designee.

Upon completion of the installation of the water system, the original signed drawing of the water construction plan must be edited to reflect actual constructed conditions (Record Drawings) by the developer/contractor, certified as such by him and turned into the City. A Record Drawing print shall be submitted for checking by the City Inspector and Public Works Department prior to submitting the revised originals. The water Record Drawing shall be submitted within 14 days of the public water main becoming live.

The installation of all water mains and appurtenances shall be in accordance with the construction plans as approved by the Public Works Director or his designee for the project. Any deviations or changes are to be approved by Public Works Director or his designee before the changes are incorporated into the work.

All materials shall be new and undamaged. Unless otherwise approved by the Public Works Director or his designee, the same manufacturer of each item shall be used throughout the work. Contractors shall furnish a water tight plug of the appropriate size which shall be installed in the end of the water main anytime work is delayed or stopped.

### 5-2 CONSTRUCTION PLANS

- A. Water plans are to be separate from others and shall have water mains highlighted and indicate locations of other utilities.
- B. Plans must show easements where mains are on private property and all hydrants, meters, and other appurtenances must be within the easements. Easements must meet the requirements of Section 5-1.
- C. Easements must be executed at completion of construction and mains must be in the middle of easement as much as possible. Access to easements for maintenance must remain open. Structures, fences, and shrubs are not to be planted on easements.
- D. Show elevations of sewer mains, water mains and storm drains where they cross each other.
- E. Potable water mains shall maintain a minimum of 10 feet horizontal clearance and 18 inches vertical separation above non-potable utilities (including sewer, storm drainage and irrigation) whenever possible. If site conditions do not allow such minimum separations, pipelines may be located closer to each other provided additional precautions are identified and instituted to assure protection of the potable line. No other utilities, potable or non-potable, shall be within 5 feet horizontal and 12 inches vertical from the water main.
- F. All installed hydrants must be covered by a burlap bag or other suitable covering until accepted by the Public Works Director or his designee and placed in service.
- G. A Washington State approved backflow prevention device is required for all irrigation systems.
- H. All environmental sensitive areas shall be shown on the water system construction plans.
- I. Plans must show required thrust restraint per Section 5-13 of these Standards.
- J. All Water Construction Plans shall be prepared, stamped and signed by an Engineer registered in the State of Washington.

### 5-2.1 REQUIRED NOTES ON PLANS

- A. No connection to the existing mains will be allowed except by means of an approved backflow prevention device prior to satisfactory flushing, testing, disinfection, and receipt of satisfactory bacteriological test results.
- B. Connections to and taps on existing mains will be made by the Public Works Department at the developer's expense. The Public Works Department shall be given at least 5 business days notice for each connection. The Public Works Department shall thereafter determine the date and time at which the connection shall be made.
- C. All work and materials must conform to City of Everett Standards.
- D. A pre-construction meeting shall be held with the City prior to the start of construction. The City of Everett Public Works Construction Division must be notified at least 24 hours prior to commencement of construction.
- E. The developer or the developer's authorized agent shall notify the Public Works Department of a person who can be contacted regarding problems during construction on a 24 hour basis.
- F. Maintain a minimum of 10 feet horizontal and 18 inches vertical separation between potable and non-potable conveyance systems.
- G. All City of Everett valves shall be operated by Public Works Department personnel only. All valves, new and existing, shall be accessible at all times.

### 5-3 BACKFLOW PREVENTION

All water system connections to serve building or properties with domestic potable water, fire sprinkler systems, or irrigation systems shall comply with the minimum backflow prevention requirements as established by the Washington State Department of Health (DOH) in WAC 246-290-490 and WAC 246-290-010 and the City of Everett Cross Connection Control Ordinance in Municipal Code 14.20.

To prevent contaminated water from the new main from entering the existing distribution system, a Washington State approved double check valve assembly shall be used on the line supplying the water and shall meet the requirements in Section 5-17 of these standards. The double check valve assembly shall be located as approved by the Public Works Director or his designee. A double check valve assembly is sufficient backflow protection only for filling and flushing of the new main. During the hydrostatic pressure test, the temporary connection between the new main and the existing distribution system shall be removed.

For fire and irrigation, the minimum level of backflow prevention required is a state approved double check valve assembly. Fire services shall have a double check detector check valve assembly. Air gaps and reduced pressure backflow assemblies must be Washington State approved and are required wherever a potential health hazard exists.

The Public Works Department has the authority to perform regular inspections on all backflow prevention assemblies connected to the City's water system and shall be provided access to the premises to inspect. The Public Works Director or his designee shall receive a passing certificate from a Washington State certified tester for all backflow prevention assemblies before releasing the certificate of occupancy on any building. A list of approved testers may be obtained from the Public Works Department.

Plan approval does not constitute approval of a backflow prevention system. A separate backflow prevention system approval must be obtained from the Public Works Director or his designee prior to initiation of water service.

#### **5-4 EXISTING UTILITIES**

When utility services occupy the same space as the new water main, the contractor shall do all necessary excavation to fully expose such services. The contractor shall protect said services and work around them during excavating and pipe laying operations. The contractor shall be responsible for all damages to the services due to his operation and shall immediately notify the Public Works Department and arrange for replacement of all damaged services.

In the event of conflict, the contractor shall remove and restore existing catch basin connections, inlet connections, drains, side sewers, inlets, and other sewerage and drainage facilities. All restoration shall be constructed to City standards. Water main pipe shall be installed to provide the minimum required clearances from non-potable conveyance systems as required in Sections 5-1 and 5-2.

It is anticipated that the contractor will encounter private water service utilities (water service lines running between the City water distribution piping and private residences) during work operations. Records of these utilities are not maintained by the City and will not be field located by the City. It shall be the contractor's responsibility to ascertain the location of and protect these private utilities from damage.

Ends of abandoned water main shall be plugged by filling with Class 3000 or Commercial Concrete for a minimum longitudinal length of twelve (12) inches.

#### **5-5 FIRE FLOW**

The fire flow requirements are determined by the Fire Department. The Public Works Department will evaluate whether the existing system will meet that requirement or if system improvements are required. Due to seasonal and other variables associated with field flow tests, these flow tests will not be used to measure the system's ability to meet the fire flow requirements.

Design and construction of water distribution system improvements necessary to meet minimum fire flow requirements for a proposed development shall be the responsibility of the developer or owner of the proposed development.

#### **5-6 PIPE AND FITTINGS FOR WATER MAINS**

##### **5-6.1 DESCRIPTION**

The work included in the following sections shall apply to the construction of water distribution mains and appurtenances for both temporary and permanent installation.

All materials shall be new and undamaged. Unless otherwise approved by the Public Works Director or his designee, the same manufacturer of each item shall be used throughout the work.

##### **5-6.2 MATERIALS**

All water main distribution piping shall be ductile iron pipe, cement lined, special thickness Class 52, unless otherwise specified and shall conform to the requirements of ANSI/AWWA C-151/A21.51, and be installed in accordance with the manufacturer's recommendations. Any deviation from this policy must be approved by the Public Works Director or his designee on the plans for the project.

Cement lining thickness shall be in accordance with ANSI/AWWA C-104/A21.4.

High Density Polyethylene Pipe (HDPE) shall not be permitted without the approval of the Public Works Director or his designee. In order to be considered for approval, the Developer shall provide a report prepared by an engineer licensed in Washington State clearly stating the need to use HDPE water main pipe. Factors to address in the report influencing use of HDPE could include, but not be limited to, soil liquefaction and high soil corrosiveness. Also include calculations, or modeling, showing fire flow demand still being met with use of HDPE pipe.

The pressure rating for HDPE water main pipe shall be the greater of 1.25 times the static pressure at the lowest point of the proposed water main system or 160 psi.

All HDPE used within the Water Distribution System shall be Ductile Iron Pipe size (DIPS), meet requirements of AWWA C906, may be designated either PE3408, PE3608 or PE4710 and shall have blue stripes co-extruded into the wall of the pipe.

Tracer wire for use with approved HDPE pipe installations shall be #10 high strength solid copper or copper clad steel with blue HDPE or HMWPE (High Molecular Weight Polyethylene) coating.

Connectors need to be the moisture displacement type.

Provide warning tape that is color coded for potable water.

### 5-6.3 JOINTS AND FITTINGS

Rubber gasket pipe joints shall be push-on-joint or mechanical joint (M.J.) in accordance with ANSI/AWWA C-111/A21.11, unless otherwise specified. Flanged joints shall conform to ANSI/AWWA C-115/A21.15.

Bolts on mechanical joints and fittings shall be tightened uniformly with a torque wrench in accordance with the manufactures recommendation for tightness and order of installation. The minimum range of torque for mechanical joints shall be as follows:

<u>Bolt size - inches</u>	<u>Range of Torque - ft/lbs</u>
5/8	40-60
3/4	60-90
1	70-100
1-1/4	90-120

Nuts spaced 180 degrees apart shall be tightened alternately in order to produce equal pressure on all parts of the gland.

Set screws on retained glands shall be torqued to manufacturer's specifications.

Bolts for fittings and joints shall be cast or ductile iron, zinc or chromium plated or stainless steel.

Cast or ductile iron fittings shall be short body for pressure rating of 150 psi, unless otherwise noted. Metal thickness and manufacturing process shall conform to applicable portions of ANSI A21.20, A21.11, B16.2 and B16.4. All fittings shall be cement lined per ANSI/AWWA C104/A21.4.

### 5-7 TRENCH EXCAVATION, BEDDING AND BACKFILL FOR WATER MAINS

### **5-7.1 DESCRIPTION**

This work shall consist of excavating, bedding, and backfilling for water mains and appurtenances, for both temporary and permanent installation under ordinary conditions.

### **5-7.2 GENERAL**

Clearing and grubbing where required shall be performed within the easement or public right-of-way as permitted by the City and/or governing agencies. Debris resulting from the clearing and grubbing shall be disposed of by the owner or contractor in accordance with the terms of all applicable permits.

Material excavated from trenches and piled adjacent to the trench or in a roadway or public thoroughfare, shall be piled and maintained so that the toe of the slope of the material is at least 2 feet from the edge of the trench. It shall be piled in such a manner as will cause a minimum of inconvenience to public travel and so that there is a minimum risk of sediment erosion. Provisions shall be made for merging traffic where such is necessary. Free access shall be provided to fire hydrants, water valves, and meters, and clearance shall be left to enable free flow of storm water in gutters, other conduits, and natural watercourses. Free access shall be maintained to all other utility control valves, meters and vaults.

### **5-7.3 GRADE AND ALIGNMENT**

Prior to any pavement cutting or removal, or excavation for pipe laying, the contractor shall verify, in the presence of the City Inspector, the locations and establish the depth of the existing water mains at the points where connections are to be made. The contractor shall verify the dimensions, type, and condition of the existing water main. The profile shall be adjusted so neither a high spot nor a low spot is created adjacent to the connection to the existing water mains.

The minimum cover for water mains less than 12 inches in diameter shall be 36 inches to the top of pipe. The minimum cover for water mains equal to or greater than 12 inches in diameter shall be 48 inches to the top of pipe. The maximum depth shall not be greater than 60 inches to the top of pipe.

All depths both minimum and maximum shall be from finish grades and shall be adhered to unless approved by Public Works Director or his designee in writing. The water line and hydrants shall be installed by line and grade information as supplied by a survey.

### **5-7.4 TRENCH EXCAVATION**

#### **5-7.4(1) GENERAL**

The contractor shall perform all excavation of every description and of whatever materials encountered. All excavations shall be made by open cut unless otherwise provided for. The bottom of trenches shall be accurately graded to provide uniform bearing and support for each length of pipe on undisturbed or compacted soil at every point along its entire length, except at the joints.

Bell holes shall be excavated to the extent necessary to permit accurate work in making and inspecting the joints. The banks of the trenches shall be kept as nearly vertical as soil conditions will permit. Where determined necessary by the contractor to control trench width, to protect adjacent structures, or to provide safe working conditions, the trench shall be properly sheeted and braced. See Section 3-9 of

these Standards for additional information on trenching including excavation, dewatering, trench width, backfill, and compaction.

**5-7.4(2) TRENCH WIDTHS**

Unless otherwise approved by the Public Works Director or his designee, the trench sides shall be excavated vertically and the trench width shall be excavated only to such widths as are necessary for adequate working space as noted on Standard Drawing No. 610. The trench shall be kept free from water until pipe joining is complete.

**5-7.4(3) CRIBBING AND SHEETING-SHORING**

The contractor shall adequately shore trenches to protect the work, existing property, utilities, pavement, etc., and to provide safe working conditions in the trench. The method of shoring shall be according to the contractor's design. The contractor may elect to use a combination of shoring and overbreak, tunneling, boring, sliding trench shields or other methods of accomplishing the work, provided the method meets all applicable local, state and federal safety codes. Damages resulting from improper cribbing or from failure to crib shall be the sole responsibility of the contractor.

At any time the City chooses to inspect or have access to the work, the work site must be in full compliance with trench safety standards as outlined in Section 3-9.1 of these Standards.

**5-7.4(4) UNSUITABLE MATERIAL**

Whenever in excavating the trench for water mains and the bottom of the trench exposes peat, soft clay, quicksand, or other unsuitable material, such material shall be removed from the trench and replaced by Foundation Material Class A as specified in Section 3-20.6 of these Specifications. All unsuitable material shall be loaded directly into trucks and hauled to a waste site obtained by the contractor. Stockpiling of unsuitable material at the project site is not permitted.

**5-7.4(5) BEDDING THE PIPE**

Bedding material, when specified or required by the Public Works Department, shall be Sand in accordance with 3-20.3 of these standards or Crushed Surfacing Base Course meeting the requirements of Section 9-03.9(3) of the WSDOT/APWA Standard Specifications. Bed the pipe within the Pipe Zone shown in Standard Drawing No. 610 and defined in Standard Drawing No. 611. Native material may be used for bedding for ductile iron pipe within the Pipe Zone if judged suitable by the Public Works Department.

**5-7.4(6) BACKFILLING TRENCHES**

See Section 3-9.3 of these Standards for unsuitable backfill except as noted herein. For water main installations, unsuitable backfill material shall be removed from the site, disposed of, and replaced by Gravel Borrow as specified in Section 3-20.2 of these Specifications and as directed by the Public Works Department.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

In backfilling the trench, the contractor shall take all necessary precautions to protect the pipe from any damage or shifting. The contractor shall backfill from the side of the trench to a maximum uniform depth of 1 foot above the crown of the ductile iron pipe before starting mechanical compaction.

During all phases of the backfilling operations and testing as outlined herein, the contractor shall protect the pipe installation, protect adjacent utilities and structures, provide for the maintenance of traffic as may be necessary, and provide for the safety of property and persons.

### **5-7.4(7)      COMPACTION OF BACKFILL**

Trench backfill shall be spread in layers and be compacted by mechanical tampers of the impact type approved by the Public Works Director or his designee. Water settling will not be permitted. After the Pipe Zone backfill is placed the remaining backfill material shall be placed in successive layers not exceeding 1 foot in loose thickness, and each layer shall be compacted to the density specified in Standard Drawing No. 615.

See Section 3-9.4 for additional requirements on compaction.

## **5-8      CONSTRUCTION REQUIREMENTS**

### **5-8.1      DEWATERING OF TRENCH**

Where water is encountered in the trench, it shall be removed during pipe-laying operations and the trench so maintained until the ends of the pipe are sealed, provisions are made to prevent floating of the pipe, and the trench has been properly backfilled and compacted in accordance with Section 5-7.4 of these standards. Trench water or other deleterious materials shall not be allowed to enter the pipe at any time. Trench water shall be discharged in accordance with Section 3-9.1 of these standards.

### **5-8.2      HANDLING OF PIPE**

All types of pipe shall be transported, handled, stored, installed and backfilled in a manner that will prevent damage to the pipe, pipe lining or coating. Pipe and fittings shall be loaded and unloaded using hoists and slings in a manner to avoid shock or damage, and under no circumstances shall they be dropped, skidded, or rolled against other pipe. Damaged pipe will be rejected, and the contractor shall immediately place all damaged pipe apart from the undamaged and shall remove the damaged pipe from the site within 24 hours.

Methods of handling shall be corrected by the contractor if the Public Works Department determines that these methods are damaging to the pipe.

All pipe to be purchased and installed as a part of the City of Everett water system shall be delivered to the job site or city yard with water tight pipe plugs. Furthermore, to comply with City of Everett Design and Construction Standards and AWWA Standards, these pipe plugs shall remain in place until the pipe is installed in the trench at which time one end plug would be removed for joining pipe ends.

The City shall reject any pipe not meeting AWWA Standards for water tight pipe plugs. Under special circumstances, the Public Works Department may reconsider the pipe after it has been swabbed out with chlorine solution and capped with water tight plugs meeting AWWA Standards.

Dirt or other foreign material shall be prevented from entering the pipe or pipe joint during handling or laying operations, and any pipe or fitting that has been installed with dirt or foreign material in it shall be removed, cleaned, and relayed. A clean whisk broom shall be used for this purpose and for brushing to

remove foreign matter prior to joining of pipe ends. At times when pipe laying is not in progress, the open ends of the pipe shall be closed by a watertight plug or by other means approved by the Public Works Director or his designee to ensure cleanliness inside the pipe.

Pipe shall be stacked in such a manner as to prevent damage to the pipe, to prevent dirt and debris from entering the pipe, and to prevent any movement of the pipe. The bottom tiers of the stack shall be kept off the ground on timbers, rails or other similar supports. Pipe on succeeding tiers shall be alternated by bell and plain end. Timbers 4 inches by 4 inches in size shall be placed between tiers and chocks shall be placed at each end to prevent movement. For safety each size of pipe shall be stacked separately.

### **5-8.3 CUTTING PIPE**

Whenever it becomes necessary to cut a length of pipe, the cut shall be made by abrasive saw or by a special pipe cutter. All pipe ends shall be square with the longitudinal axis of the pipe and the outside shall be beveled and otherwise smoothed so that good connections can be made without damage to the gasket. Threads shall be cleanly cut. Oxyacetylene torch cutting of ductile iron pipe is not permitted.

### **5-8.4 LAYING PIPE ON CURVES**

Long radius curves, either horizontal or vertical, may be laid with standard pipe by deflecting the joints. If the pipe alignment is shown curved in the drawings and no special fittings are shown, the contractor can assume that the curves can be made by deflecting the joints with standard lengths of pipe. If shorter lengths are required, the drawings will indicate maximum lengths that can be used. The amount of deflection at each pipe joint when pipe is laid on a horizontal or vertical curve shall not exceed the manufacturer's printed recommended deflections.

Where field conditions require deflection or curves not anticipated in the drawings, the Public Works Department will determine the methods to be used.

When rubber gasketed pipe is laid on a curve, the pipe shall be jointed in a straight alignment and then deflected to the curved alignment. Trenches shall be made wider on curves for this purpose. Maximum deflections at pipe joints and laying radius for various pipe lengths shall conform to the manufacturers and/or AWWA standard, whichever is more conservative, for the given type of pipe.

### **5-8.5 CONNECTIONS TO EXISTING MAINS**

All new taps and/or connections to existing water mains shall be done by the Public Works Department unless specifically approved in writing by the Public Works Director or his designee. All costs incurred shall be borne by the developer or contractor requesting the service. It shall be the contractor's responsibility to arrange for the taps with the Public Works Department. A deposit is required for the work to be done must be paid prior to any work being scheduled or done by City forces. The amount of the estimate for the cost of the work will be determined by the Public Works Department.

The City Development Technician will initiate a request to the Public Works Department for a cost estimate to tap the existing water main and to extend the water line to a designated point at the edge of the right-of-way furthest from the tapping location. In the case of an existing water line easement, the designated point will be up to one (1) pipe length beyond the tapping connection.

After receiving the required deposit for the estimated work, the Public Works Department will schedule, order materials, and perform the described work as outlined in the estimate.

No water system valves on existing mains shall be operated by the contractor. The Public Works Department will operate all valves to accomplish shutdowns and subsequent reactivations. Draining of existing water mains will be done by the Public Works Department.

The developer/contractor will connect a double check valve assembly to the end of the water line at the designated point as shown on the approved plans. The double check valve assembly will be required during flushing and purity tests. The temporary connection between the new main and the existing distribution system shall be removed during the hydrostatic pressure test.

After receiving satisfactory purity tests, the developer/contractor will notify the public works inspector to schedule the removal of the double check assembly and the final connection by the Public Works Department.

Preparing the work site for work performed by the Public Works Department is the responsibility of the developer / contractor. The work site must meet all safety requirements outlined in these standards, including but not limited to shoring per Section 3-9.1 of these standards, traffic control, adequate overhead clearance, and other requirements as determined by the Public Works Department. City forces will not perform work until the site is in full compliance. If the site is not fully ready at the scheduled connection time, all costs for City forces to prepare, shore, or standby will be borne by the developer / contractor. If added safety measures are necessary as determined by the City, these costs shall be borne by the developer / contractor.

#### **5-8.6 LOOPED MAINS**

Unless otherwise approved by the Public Works Director or his designee, dead ending of a water main will not be permitted. All new mains must be looped to existing water mains. In the event it is necessary for the developer to obtain an easement for the City through private property to accomplish looping of the dead end, the easement shall meet the minimum requirements set forth in Sections 5-1 and 5-2 of these Standards.

#### **5-8.7 LAYING HDPE MAINS**

Lay HDPE in trench on an approved bedding so one co-extruded blue strip is at the twelve o'clock position.

Install tracer wire slightly and directly above crown of HDPE. Secure wire to pipe so that backfill operations do not significantly move the wire.

Run tracer wires up to top of main line valve box and terminate under the valve box lid.

Install potable water color coded warning tape one foot above the top of the pipe.

Perform conductivity test in presence of City Inspector prior to City's accepting the work.

### **5-9 SERVICE LINES**

#### **5-9.1 GENERAL**

Service lines from the water main to the meter for all services 2 inches and smaller shall be copper in all non-residential applications and polyethylene tubing in residential applications. A number 10 copper trace wire is required for polyethylene pipe. All service lines 3 inches and larger shall be cement lined ductile iron pipe (Special Class 52) from the main to the meter.

All service connection piping within the public right-of-way shall be a minimum of 30 inches below the finish grade surface. For further details on services and hook-ups, see the series 500 Standard Drawings.

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

On services installed in conjunction with new water mains, it is required that the services be installed from the main to the permanent meter location and be subjected to purity and hydrostatic testing with the new water main as detailed in Sections 5-14 and 5-15.

### 5-9.2 MATERIALS

Copper tubing shall conform to the requirements of ASTM B88 (ANSI H33.1), Type K, annealed tubing. The tubing shall be coupled using flare-type compression fittings conforming to the requirements of AWWA C800, minimum 150 psi working pressure.

Polyethylene tubing shall only be permitted in residential applications and shall conform to the requirements of AWWA C901. The pipe shall bear the seal of the National Sanitation Foundation for potable water pipe. Pipe joints shall be made in accordance with the manufacturer's recommendations. Solvent welded pipe joints are not permitted. Pipe shall be per Standard Plan 502A, 502B or 502C of these standards.

Ductile iron pipe shall conform to the requirements shown in Section 5-6.2 of these Standards.

### 5-9.3 CONNECTIONS

Service connections on 4 inch ductile iron mains or larger shall be installed per Standard Drawings 502A, 502B and 502C.

No service connections may be installed on fire service mains or on fire hydrant laterals between the hydrant valve and the fire hydrant.

## 5-10 VALVES FOR WATER MAINS

### 5-10.1 GENERAL

All valves shall be inspected upon delivery in the field to ensure they are in proper working order before installation and they shall be free of all rust and dirt. They shall be set and jointed to the pipe in the manner as set forth in the AWWA Standards and the manufacturer's recommendations for the type of connecting ends furnished. The valves shall also be carefully inspected for injury to the outer protective coatings.

A Valve Operating Nut Extension shall be installed when the ground surface is more than 36 inches above the valve operating nut. The Valve Operating Nut Extension shall be installed per Standard Drawing 504. When required, it shall be furnished and installed by the contractor.

At a minimum, valves shall be installed at all intersections, on each end of easements, and in line at maximum spacing of 600 feet.

### 5-10.2 AIR AND VACUUM RELEASE VALVES

Air and vacuum release valves must have prior approval from the Public Works Director or his designee before installation.

### 5-10.3 BUTTERFLY VALVES

Butterfly valves shall conform to AWWA C504, Class 150, with cast iron short body and "O" ring stem seal. Butterfly valves shall be used for all mains over 12 inches in diameter, except as noted in Section 5-10.5.

Butterfly valves in chambers shall have a manual crank operation.

Buried butterfly valves shall have a valve operating nut extension per Section 5-10.1 and as shown on Standard No. 504.

#### **5-10.4 CHECK VALVES**

Check valves for permanent installations other than cross connection control shall be rated for the source pressure, unless otherwise specified, and shall have adjustable tension lever and spring to provide non-slamming action under all conditions unless otherwise specified. For backflow prevention see Section 5-3.

#### **5-10.5 GATE VALVES**

Buried gate valves shall be ductile iron body, resilient wedge design, non-rising stem suitable for installation with the type and class of pipe being installed. Operating Stems are to be equipped with standard 2 inch operation nut and "O" ring stem seals. Valves must be of the type to have two "O" ring stem seals in the stuffing box of the valve to facilitate seal replacement without valve dismantling.

Gate valves shall only be used for mains 12 inches and smaller in diameter, all mains larger than 12 inches in diameter shall utilize butterfly valves, except as approved by the Public Works Division.

Valves not buried shall be specified on the developer's plans and must be approved by the City Utility Department.

Two inch gate valves shall be heavy duty resilient wedge design and 2" operating nut. All gate valves shall be American Flow Control (old Waterous) Series 2500 or City approved equal.

#### **5-10.6 VALVE BOXES**

Valve boxes and valve operating nuts extensions shall be as specified in Standard Plan No. 504 and Section 5-10.1 of these Standards.

The valve and valve box shall be set plumb with the valve box centered on the operator nut. Valve boxes shall be set flush in pavement and gravel roads. Two (2) feet of asphalt concrete pavement is required around the valve box in gravel roads.

#### **5-10.7 VALVE MARKER POSTS**

Marker posts per Standard No. 510 shall be installed for all valves located in unimproved or unpaved areas not in City limits. Valve marker posts shall be set as directed by the City inspector in a safe and reasonable conspicuous location. The distance to the valve is to be neatly stenciled on the post with 2 inch numerals. Valve marker posts are not required for auxiliary hydrant valves.

### **5-11 HYDRANTS**

#### **5-11.1 GENERAL**

Fire hydrants shall be installed in accordance with Standard Plan No. 507, at locations as shown on the approved plans.

Hydrants shall be the "Traffic Model" type with approved breakaway features. All hydrants shall be brass to brass subseat, minimum valve opening of 5-1/4 inches "O" ring stem seal, 6 inch mechanical or flange

shoe connection, 1-1/4 inch pentagonal operating nut. Approved models are listed on Standard Drawing No. 507.

All hydrants shall have a minimum of two (2) 2-1/2 inch ports with National Standard Threads and one (1) 4-1/2 inch National Standard Thread pumper connection.

All hydrants shall have a 5 inch Stortz metal face adapter x female hydrant thread with cap. The adapter shall be aluminum alloy (6061-T6 minimum) forged or extruded and shall have a hard coat anodized finish to mil-A-8625c. The Stortz adapter shall be specified to meet a 500 psi test and permanently attached in accordance with 5-11.2 and 5-11.3.

#### **5-11.2 ADAPTER REQUIREMENTS**

- A. Overall diameter not to exceed 7-3/4 inches.
- B. Overall length not to exceed 4-1/4 inches.
- C. To be supplied with two holes, 1/4-20 nc, drilled and tapped with set screws, 180 degrees apart through female thread, to lock adapter to hydrant.
- D. To be supplied with any required sealant and/or gasket.
- E. Two sets of installation tools.

#### **5-11.3 CAP REQUIREMENTS**

- A. One seal to be nitrile/vinyl rubber, suction style for zero leakage, color to be gray.
- B. One-eighth inch vinyl covered aircraft cable, 18 inches minimum length to be attached to cap and adapter.
- C. Force to connect or disconnect to be a minimum of 18 ft/lbs, maximum of 30 ft/lbs.
- D. Outside diameter (not to exceed) 7-3/4 inches, overall length (not to exceed) 2 inches.

All hook-ups to fire hydrants for temporary water for whatever purpose shall be approved by the City Utility Department and will require a Hydrant Use Permit.

Hydrants installed in unpaved areas shall have a 4 inch thick, 3 feet square concrete pad poured around them per Standard No. 509.

#### **5-11.4 HYDRANT GUARD POSTS**

Hydrant guard posts, when required, shall be installed per Standard No. 510.

#### **5-12 PRESSURE REDUCING STATIONS**

When pressure reducing stations are required or needed, all pipe, fittings, and equipment shall be supported and restrained against static and dynamic loading in accordance with the equipment manufacturers' recommendations and as approved by the Public Works Director or his designee. Drain lines from pumps or other equipment shall be piped to a below grade drainage system connected to the station sump or drain. All drains shall utilize either an air gap or approved backflow prevention assembly to eliminate potential contamination.

#### **5-13 THRUST RESTRAINT**

All bends, tees and fittings shall be restrained. Mechanical joint restraint systems shall be used for thrust restraint unless otherwise noted in this section.

Restraint length shall be calculated in accordance with AWWA and the latest edition of Thrust Restraint Design for Ductile Iron Pipe published by the Ductile Iron Pipe Research Association (DIPRA).

**DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS**

Calculations shall be prepared by an engineer licensed in the State of Washington and shall use the following parameters:

- Safety Factor: 1.5
- Trench Type: See Section 5-7.4 of these Standards.
- Depth of Bury: See Section 5-7.3 of these Standards.
- Test Pressure: See Section 5-14 of these Standards.

Restraint length calculations must be submitted with the water plans. These calculations must identify each variable and equation used including pipe material, design pressure, safety factor, soil type, trench type, and depth of bury.

Computer software programs for thrust restraint design that utilize the same engineering principles, criteria, and analytical approach as the DIPRA design requirements may be used (i.e. software by DIPRA, EBAA Iron Sales, etc). When computer software programs are used for calculations, a printout showing the name and publisher of the program, the calculations from where the restrained length is derived as well as the criteria used must be submitted for review with the water plans.

Thrust restraint for horizontal bends may be calculated based on the above criteria. Alternatively, the values listed in Table 5A may be used.

**Table 5A**  
**Horizontal Thrust Restraint Length**

Fitting	Pipe Diameter		
	6"	8"	12"
	Length to be Restrained in Each Direction		
11-1/4° bend	5'	5'	10'
22-1/2° bend	10'	10'	15'
45° bend	15'	20'	25'
90° bend*	35'	45'	60'
Tees (where all legs can be restrained)*	20'	25'	55'
Dead Ends and Tees (where only one branch is installed)*	60'	80'	115'

\* 90° bends, tees, bends connecting to cast iron pipe, and dead ends must use thrust blocks in addition to this table.

Concrete thrust blocks and gravity blocks may only be used where thrust restraint cannot be achieved by mechanical means, with the exception of 90° bends, tees, bends connecting to cast iron pipe, and dead ends, which must have concrete thrust blocks in addition to thrust restraints. All thrust blocking must be designed by an engineer licensed in the State of Washington and shall be calculated in accordance with AWWA and the latest edition of Thrust Restraint Design for Ductile Iron Pipe published by the Ductile Iron Pipe Research Association (DIPRA). Blocking shall be commercial concrete mix poured in place. Thrust blocking calculations must be submitted with the water plans for review and approval by the Public Works Director or his designee.

**5-14 HYDROSTATIC PRESSURE TEST**

All water mains and appurtenances shall be hydrostatically tested as specified in Section 7-09.3(23) of the WSDOT/APWA Standard Specifications. A copy of this test procedure is included in the back of this Section. Information on the operating pressure to be used when determining the test pressure can be obtained from the Public Works Department.

The contractor shall provide all necessary equipment and shall perform all work connected with the tests. The contractor shall perform the test to assure that the equipment to be used for the test is adequate and in good operating condition and all air has been released prior to requesting the city inspector to witness the test. If the initial test is not successful for any reason, additional trips required for City staff to witness or perform subsequent tests shall be at the developer’s expense.

**5-15 DISINFECTION OF WATER MAINS**

Water mains shall be hydrostatically tested as specified in section 5-14 before disinfection can take place.

Before being placed in service, all newly installed pipe shall be flushed and disinfected with a chlorine solution and satisfactory coliform bacteria test report(s) obtained.

Disinfection of water mains shall be performed in accordance with AWWA Standard C651-05 and these Standards.

**5-15.1 FLUSHING**

Sections of pipe to be disinfected shall first be flushed to remove any solids or contaminated material that may have become lodged in the pipe. If no hydrant is installed at the end of the main, then a tap sufficient to provide a flush velocity inside the main of at least 2.5 fps shall be provided. At a minimum, the flush shall discharge one entire pipe volume of water from the new main. Flushing shall continue as long as material or color is visible in the discharge.

**Guidelines for Required Flow and Openings to Flush Pipelines  
(Assumes 40 psi residual pressure in water main)**

Pipe Diameter (in)	Flow Required to Produce 2.5 fps (approx.) Velocity in Main (gpm)	Size of Tap (in)			Number of 2-½ in Hydrant Outlets	Maximum Length of Supply Hose (ft)
		1 in	1 ½ in	2 in		
4	100	1			1	500
6	200		1		1	100
8	400		2	1	2	100
10	600		3	2	2	100
12	900			2	2 (3” Dia. Hose)	100

**Guidelines for Water Main Volume**

Inside Diameter (in)	Volume per 100 LF (gal)
4	65
6	147
8	261
10	408
12	587
20	1,632

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

Alternate hose diameters and lengths can be used for flushing if calculations supporting their use are prepared by an engineer and approved by the Public Works Director or his designee.

Taps and other appurtenances required by the contractor for temporary release of air, chlorination, or flushing purposes shall be provided by the contractor as a part of the construction of water mains.

To protect aquatic life in receiving waters, the contractor shall be responsible for disposal of all chlorinated water flushed from mains and shall neutralize the chlorine contained in the wastewater before disposal into any natural drainage channel (or feature draining to a natural channel). The contractor shall be responsible for disposing of disinfecting solutions to the satisfaction of the Public Works Department and the Washington Department of Ecology. If approved by the Public Works Director or his designee, disposal may be made to any available sanitary sewer, provided the rate of disposal will not overload the sewer.

When flushing following the repair of a main break, and the main segment containing the repaired section cannot be hydraulically isolated to the nearest hydrant, the Contractor shall install a 2-inch tap and gate valve at the repaired section to provide for proper flushing.

### 5-15.2 DISINFECTANT CONCENTRATION AND RETENTION PERIOD (CONTACT INTERVAL)

Before being placed into service, all new mains and repaired portions of, or extensions to, existing mains shall be disinfected so that a free chlorine residual of not less than 10 mg/l remains in the disinfectant solution after standing 24 hours in the pipe. The initial free-chlorine residual concentration of disinfectant solution shall be not less than 25 mg/l. Disinfectant chlorine solution contact time may be reduced from 24 to 12 hours if an initial disinfectant concentration of 50 mg/L is used. Disinfectant concentrations greater than 50 mg/L shall not be used. The ending concentration of an initial 50 mg/L solution following a 12 hour contact time shall also be not less than 10 mg/L.

The amounts of chlorine (Cl<sub>2</sub>) required to provide 25mg/l for 100-foot lengths of various diameter of pipe are:

#### AMOUNTS OF CHLORINE REQUIRED FOR 25 MG/L DOSAGE

Pipe Size (inches)	Volume of Water Per 100 ft length (gallons)	Household Bleach 6% (gallons)	Commercial Bleach 12-1/2% (gallons)
4	65.3	.03	.013
6	146.5	.06	.03
8	261.0	.11	.053
10	408.0	.17	.08
12	588.7	.25	.12
14	799.6	.33	.16
16	1044.4	.44	.21
20	1631.9	.68	.33
24	2349.9	.98	.47
30	3671.7	1.5	.75

## DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS

36	5287.3	2.2	1.1
42	7196.6	3.0	1.44
48	9399.6	3.9	1.6

### 5-15.3 FORM OF APPLIED CHLORINE

Disinfection of water mains shall only be performed using the continuous feed method employing liquid hypochlorite solutions (liquid calcium hypochlorite or liquid sodium hypochlorite). Dry calcium hypochlorite shall not be used. Gaseous chlorine (also known as liquid chlorine) shall not be used.

Except for Everett's prohibition on the use of dry calcium hypochlorite or gaseous chlorine, disinfection shall follow the continuous feed methods specified in the most recent version of AWWA Standard C-651 and these Standards.

### 5-15.4 POINT OF APPLICATION

The preferred point of application of the disinfectant solution is at the beginning of the pipeline extension or any valved section of it. The water injector for delivering the chlorine disinfectant solution into the pipe shall be supplied from a tap on the pressure (upstream) side of the valve controlling the flow into the pipeline extension, but downstream of the backflow preventer used to isolate the new main from the existing water distribution system. Alternate points of applications may be used when approved in writing by the Public Works Director or his designee.

If the Public Works Department has allowed a direct tie-in to an existing main via an in-line backflow preventer, the point of application may be through a corporation stop inserted in the horizontal axis of the pipe with the approval of the Public Works Director or his designee. The tap must be located within ten feet of the point where the line is tied into the existing system. The internal surfaces of any backflow preventer and any adjacent downstream appurtenances (valves or couplings) shall be swabbed with straight hypochlorite solution prior to installation.

### 5-15.5 PREVENTING REVERSE FLOW

No connections shall be made between the existing distribution system and pipelines that are constructed by the developer that have not been flushed, disinfected, and tested, without a State Department of Health approved backflow preventer installed in the connecting line. All backflow preventers shall be installed upstream of all temporary fill hoses and disinfectant injection equipment.

### 5-15.6 CHLORINATING VALVES, HYDRANTS, AND APPURTENANCES

During the disinfectant contact interval for newly-laid pipe, all valves, hydrants, and other appurtenances shall be operated while the pipeline is filled with the disinfectant chlorine solution and while the main is under normal operating pressure (normal operating pressure is defined as the pressure that can be provided by the temporary backflow protected supply from the existing distribution system).

### 5-15.7 CHLORINATING CONNECTIONS TO EXISTING WATER MAINS AND WATER SERVICE CONNECTIONS

The chlorinating procedure to be followed shall be as specified in Section 4.6 (Final Connections to Existing Mains), 4.7 (Disinfectant Procedures When Cutting Into or Repairing Existing Mains), and 4.8 (Special Procedures for Caulked Tapping Tees) of the most recent version of AWWA Standard C651. The internal surfaces of all closure fittings shall be swabbed with a concentrated chlorine solution at least as strong as liquid household sodium hypochlorite bleach (5-6% Cl).

### **5-15.8 FINAL FLUSHING AND TESTING**

The contractor shall notify the Public Works Department at least 48 hours prior to requiring City staff to collect samples and measure the chlorine concentration of the disinfectant solution placed in the new main. Samples will be collected and measured at the start and at the end of the disinfectant contact period.

Disinfectant concentration samples will be collected from both ends of a new main, at the end(s) of each cross or branch if any, and every 1200 feet along the main.

The contractor shall notify the Public Works Department at least 48 hours prior to requiring collection of final purity (coliform bacteria and free chlorine residual) samples by City staff.

At least one set of purity samples shall be collected from every 1,200 ft of the new water main, plus one set from the end of the line and at least one set from the end of each branch. Samples from the main and branch ends shall not be collected more than 10 ft from each end of the pipe.

Before placing the lines into service, a satisfactory bacteriological analysis sample report for samples collected from representative points in the new system shall be received from the laboratory. Only laboratories certified by the Washington State Department of Health, Drinking Water Division will be employed to analyze bacteriological purity samples. The City Utilities Department will collect bacteriological and disinfectant residual samples and will also obtain analysis of the samples.

Following chlorine disinfection, all disinfectant solution shall be flushed from the newly-laid pipe until the replacement water throughout its length shows, upon test, a level of free chlorine residual representative of the supply water from the distribution system.

### **5-15.9 SAMPLE COLLECTION TAPS**

The contractor shall construct water sample collection taps at each required sampling location. The end of each water sample collection tap shall be located above ground level (not in holes, under plates, or other inaccessible locations). Taps shall be plumbed to provide downward water flow adequate to effective filling of sample containers. Public Works Department staff shall have the authority to refuse to conduct monitoring (sampling) for main purity from taps which they consider inadequate or not representative of water main quality.

On mains requiring sample collection from locations between the ends, the contractor shall provide for sample collection by installing water services specified in the plans, or if none are specified, at appropriate locations, by installing water service corporation stops and services at the appropriate locations along the main.

Service taps installed to provide mid-line sample collection locations that will not provide service to a customer shall be plumbed into dead-end meter setters and meter boxes at the street or sidewalk edge for use as future dedicated sampling locations. Meter setters provided for this purpose shall be of the type with stop valves located on both sides of the setter piping.

A sample tap shall be located ahead (upstream) of the flushing hose connection for sanitary and disinfectant residual sampling. Due to sanitary and representative sampling issues, no hose or fire hydrant (other than the temporary fill hydrant) shall be used in the collection of free chlorine or bacteriological samples.

### **5-15.10 REPETITION OF FLUSHING AND TESTING**

Should the initial disinfection procedure result in an unsatisfactory bacteriological test (total coliform bacteria present), the entire flushing and disinfection procedure shall be repeated by the Contractor until satisfactory results are obtained. Failure to get a satisfactory test shall be considered as failure of the contractor to keep the pipe, sample taps, and temporary filling attachments clean during construction, or to properly flush and disinfect the main.

### **5-16 UNDERGROUND UTILITIES**

Activities such a trench excavation, tunneling or boring, pipe embedment, backfilling, compaction, safety and pavement patching, whether for public or private utilities, shall conform to the requirements set forth in this Section and other Sections of these standards. For all the above, except pavement patching, see Section 3-9 Underground Utilities and Standard Plan Nos. 610, 611 and 615. For pavement patching see Section 3-14 and Standard Plan 316.

### **5-17 WATER SERVICES FOR FIRE PROTECTION**

All fire protection systems must meet all building codes and fire codes. All fire systems must have a State approved double check valve assembly. These assemblies may be installed inside the building with Public Works Director or his designee approval and must meet Section 5-3 of these Standards.

Fire services 4" and larger must be a Double Check Detector Valve Assembly per City Standard 515 or 523.

The backflow prevention system must be installed downstream of the fire meter and upstream of any device (post indicator valve, fire department connection, etc.).

Backflow prevention systems must be installed within 70 ft. of the water main unless otherwise approved by the Public Works Director or his designee.

## SECTION 6 - SANITARY SEWERS

### 6-1 GENERAL

Construction of all sanitary sewer mains, side sewers (laterals), and related facilities, including but not limited to sewer lift stations, telemetry facilities and appurtenances will be under the supervision of the City and shall be in compliance with all ordinances and current Standards of Everett.

Sewer main extensions will be required when the property does not front on a sewer main or when the existing sewer main is not adequate for the increased use proposed. The minimum extension shall be to a point at least 5 feet inside the prolongation of the property line.

All pipe installed shall be structurally sound for the design depth.

All requests for inspections and for witnessing tests shall be scheduled with the public works inspector 24 hours in advance. Failure to give adequate advance notice may result in delays to the contractor for required inspections.

### 6-2 ALIGNMENT TOLERANCE

The maximum tolerance from true line and grade shall be as follows:

- A. Maximum deviation from established line and grade shall not be greater than 1/32 inch per inch of pipe diameter and not to exceed 1/2 inch per pipe length.
- B. No adverse grade in any pipe length will be permitted.
- C. The difference in deviation from established line and grade between two successive joints shall not exceed 1/3 of the amounts specified above.

### 6-3 CONSTRUCTION PLANS

The installation of all extensions to the sanitary sewer system shall be done per plans which have been approved by the City Engineer.

Sanitary sewer plans are to be separate from other utility plans, but all other utilities are to be shown, the with sanitary sewer portions highlighted.

Plans should be prepared on 24 inch by 36 inch plan/profile type sheets and shall show both plan and profile views. Other utilities are to be shown in profile view and in plan view.

The minimum allowable scale shall be 1 inch = 40 feet; on small projects, it shall be expected that the scale will be enlarged to adequately utilize the full plan sheet.

Provide notes on plans that refer to specific City Standards for such things as manholes, drop connections, side sewers, etc.

Plans shall show invert elevations of the main at the outlet and all inlets of each manhole, slope of the main and surface elevations of the manhole lid. In the profile view, the finish ground elevation over the pipe shall be shown as well as crossings of other existing or proposed utilities. Stationing of side sewers from the downhill manhole is required.

In all cases where a line is to be placed in an easement, the easement is to be shown with measurement information to accurately lay it out prior to constructing the pipe line.

Upon completion of construction, the original of the plan shall be as-built by the developer and certified as as-built by him and turned into the Public Works Department with properly executed easement deeds as applicable for the project.

### **6-3.1 REQUIRED NOTES ON PLANS**

The following standard notes are required on all Sanitary Sewer Plans:

- A. All work and materials shall conform to the City of Everett Standards and WSDOT/APWA Standard Specifications.
- B. No part of the sanitary sewer system shall be covered, concealed or put into use until it has been tested, inspected, and approved by the city inspector.
- C. Approximate locations of existing utilities have been obtained from available records and are shown for convenience. The contractor shall be responsible for verification of locations and to avoid damage to any additional utilities not shown. If conflicts with existing utilities arise during construction, the contractor shall notify the public works inspector and any changes required shall be approved by the City Engineer prior to commencement of related construction on the project.
- D. All sewer main extensions within the public right-of-way or in easements must be staked by survey for line and grade prior to starting construction.

### **6-4 EASEMENTS**

All public sewer mains not in the public right-of-way shall be in easements granted to the City of Everett.

All public sewer main easements shall be a minimum of 20 feet wide, with the sewer main ideally being the center of the easement.

No permanent structures are allowed to be constructed in the easement area.

Vehicle access, as approved by the City Engineer, will be provided to all manholes.

All easements except for special circumstances shall be located to run within single lots rather than being split by a lot line.

Landscaping within sanitary sewer easements shall be restricted to low growing shrubs, grasses, beauty bark, etc.

### **6-5 LIFT (PUMP) STATIONS**

All side sewers must gravity into the city's sanitary system. The city does not promote the construction of individual side sewer pumps or public service pump stations. The city will only consider this method if no area gravity system can be constructed. Private pressure lines are not permitted on public right-of-way. If no gravity system can be constructed and a nongravity system has been approved by the city, the private pressure lines must enter a manhole on private property and gravity into the public system with a standard side sewer connection. The minimum manhole size permitted for this application is 30 inch diameter installed with a locking lid frame and cover per Standard Plan No. 607.

Plan for lift stations must be approved by the Utilities division of Public Works. The following items are to be considered for each application:

- A. Lift stations must be a wet well-dry well type.
- B. Lift stations must be set up with auxiliary power, including automatic transfer switch.
- C. Provisions for telemetry shall be required.

## **6-6 MANHOLES**

### **6-6.1 DESCRIPTION**

This work shall consist of constructing manholes in accordance with these Specifications, the Standard Plans and Section 7-05 of the WSDOT/APWA Standard Specifications. Where conflicts occur, these Specifications shall have precedence over Section 7-05 of the WSDOT/APWA Standard Specifications.

### **6-6.2 MATERIALS**

Manholes shall be constructed of pre-cast units, in accordance with Standard Plan Nos., 605A, 605B and 605C. Any deviations from Standard Plans will be subject to a shop drawing submitted by the contractor and approved by the City Engineer.

Joints between manhole elements shall be rubber gasket.

All pre-cast concrete shall be Class 4000. Manhole channels shall be Class 3000 concrete. Concrete blocks or concrete (masonry) rings may be used for adjustment of the casting to final street grade.

Standard precast cones shall provide reduction from 48 inches to 24 inches with height of not less than 18 inches and 54 to 24 inches with height of not less than 24 inches.

Standard flat slab covers shall be a minimum of 8 inches thick and shall conform to the outer dimension of the standard sections upon which they are to be placed.

### **6-6.3 CONSTRUCTION REQUIREMENTS**

#### **6-6.3(1) BEDDING**

Unless otherwise directed by the City Engineer, manholes constructed with pre-cast base sections or cast-in-place sections shall be placed to grade upon a 6 inch minimum depth of Crushed Surfacing Base Course meeting the requirements of Section 9-03.9(3) of the WSDOT/APWA Standard Specifications. The Crushed Surfacing Base Course shall be compacted to 95% maximum density.

#### **6-6.3(2) JOINTS**

Joints between pre-cast manhole elements shall be rubber gasketed in a manner similar to pipe joints conforming to ASTM C443. Shop drawings of the joint design shall be submitted to the City Engineer for approval, prior to manufacturer. Completed joints shall show no visible leakage and shall conform to the dimensional requirements of ASTM 478.

**6-6.3(3) MANHOLE CHANNEL**

All manholes shall be channeled unless otherwise approved by the City Engineer. Manhole channels shall be made to conform accurately to the sewer grade and shall be brought together smoothly with well rounded junctions. Channel sides shall be carried up vertically to the crown elevation of the various pipes, and the concrete shelf between channels shall be smoothly finished and warped evenly with slope to drain.

**6-6.3(4) MANHOLE PIPE CONNECTIONS**

All pipes except PVC pipe entering or leaving the manhole shall be provided with flexible joints within  $\frac{1}{2}$  of a pipe diameter or 12 inches, whichever is greater, from the outside face of the manhole structure and shall be placed on firmly compacted bedding, particularly within the area of the manhole excavation which normally is deeper than that of the sewer trench. Special care shall be taken to see that the openings through which pipes enter the manhole are completely and firmly rammed full of non-shrink grout to ensure water tightness (see Section 3-20(8) for non-shrink grout).

PVC pipe connected to manholes shall be provided with a manhole adaptor complete with gasket and approved by the City Engineer. No pipe joints in PVC shall be placed within 10 feet of the outside face of the manhole.

**6-6.3(5) LADDER**

All manholes over 3 feet in height shall be provided with a ladder or steps as specified in Standard Plan No. 606.

**6-6.3(6) CONNECTIONS TO EXISTING MANHOLES**

The contractor shall verify invert elevations prior to construction. The crown elevation of laterals shall be the same as the crown elevation of the incoming pipe unless specified. The existing base shall be reshaped to provide a channel equivalent to that specified for a new manhole.

Inside drops shall be used to connect to existing deep manholes. Outside drops will be allowed only where specifically allowed by the City Engineer.

The contractor shall excavate completely around the manhole to prevent unbalanced loading. The manhole shall be kept in operation at all times and the necessary precautions shall be taken to prevent debris or other material from entering the sewer, including a tight pipeline bypass through the existing channel if required.

The contractor shall core drill, line drill or wall saw an opening to match the size of pipe to be inserted. Where line drilling is the method used, the drilled holes must be interconnected. Line drilling shall be accomplished by the use of a small core drill or a rotary hammer. Jackhammer shall not be used. All openings must provide a minimum of 1 inch and a maximum of 2 inches clearance around the circumference of the pipe. Upstream pipes, except PVC pipe, penetrating the walls of manholes shall be placed with the bell facing out such that the bell is placed snug against the outside wall of the structure as the angle of penetration allows. Pipe, except PVC pipe, leaving or entering manholes shall be provided with a flexible joint within  $\frac{1}{2}$  of a pipe diameter, or 12 inches, whichever is greater. After pipes have been placed to their final position, they shall be grouted tight with non-shrink grout in a workmanlike manner. PVC pipe connecting to existing manhole shall be per Section 6-6.3(4).

### **6-6.3(7) SPACING**

Maximum spacing of manholes shall be 400 feet, unless approved by the Utilities. All manholes are to be accessible to maintenance vehicles.

Manholes will be required at any change in pipe slope, alignment, or size. Manholes are not allowed in a fill section unless base is on a cut section. A manhole is required at the ends of all sewer mains.

## **6-7 SEWER MAIN**

### **6-7.1 MATERIALS**

Materials for sanitary sewer pipe shall meet the requirements of the following:

1. Plain Concrete Sewer Pipe: Plain concrete sanitary sewer pipe shall meet the requirements of ASTM C14 Class 3, unless otherwise approved.
2. Reinforced Concrete Sewer Pipe: Reinforced concrete sanitary sewer pipe shall conform to ASTM Designation C76 and shall be of the class specified or on the plans.
3. PVC Sewer Pipe: Polyvinyl Chloride (PVC) sanitary sewer pipe shall conform to the requirements of ASTM D3034 SD4 35.
4. Ductile Iron Sewer Pipe: Ductile iron sanitary sewer pipe shall conform to ANSI A 21.51 or AWWA C151 and shall be cement mortar lined, push-on joint or mechanical joint. The ductile iron pipe shall be Class 52, unless otherwise approved.

### **6-7.2 GENERAL**

The maximum permissible trench width between the foundation level and to 12 inches above the pipe shall be 40 inches for pipe 15 inches or smaller inside diameter of 1 ½ times the inside diameter plus 18 inches for pipe 18 inches or larger (see Standard Plan No. 611). If the maximum trench width is exceeded without written authorization of the City Engineer, the contractor will be required to provide pipe of higher strength classification or to provide a higher class of bedding, as required by the City Engineer.

During excavation and installation of pipelines and placement of trench backfill, excavations shall be kept free of water. The contractor shall control surface run-off so as to prevent entry or collection of water in excavations. The static water level shall be drawn down a minimum of one foot below the bottom of the excavation so as to maintain the undisturbed state of the foundation soils and along the placement of any fill or backfill to the required density. The dewatering system shall be installed and operated so that the ground water level outside the excavation is not reduced to the extent that would damage or endanger adjacent structures or property.

### **6-7.3 UNDERGROUND UTILITIES**

Activities such as trench excavation, tunneling or boring, pipe embankment, backfilling, compaction, safety and pavement patching, whether for public or private utilities, shall conform to the requirements set forth in other sections of these Standards. For all the above except pavement patching, see Section 3-9 Underground Utilities and Standard Plan Nos. 610, 611, and 615.

#### **6-7.4 PIPE BEDDING**

Bedding for all pipe shall be Crushed Surfacing Base Course (CSBC) meeting the requirements of Section 9-03.9(3) of the Standard Specifications for Road, Bridge, and Municipal Construction. Bedding will be to the pipe zone shown on Standard Drawing 611. The pipe zone is identified as 6 inches below the bottom of the pipe to 12 inches above the pipe. As an option the contractor may use controlled density fill as specified in Section 3-1 of these Specifications.

Bedding shall be placed in more than one lift. The first lift, to provide at least 6 inches thickness under and portion of the pipe, shall be placed before the pipe is installed and shall be spread smoothly so that the pipe is uniformly supported along the barrel. Subsequent lifts of not more than 6 inches thickness shall be installed to the crown of the pipe and individually compacted to 90% density as determined by ASTM D698. A further 12 inch lift of moderately compacted material shall be placed over the crown of the pipe prior to the start of backfilling the trench.

#### **6-7.5 LAYING SEWER PIPE**

All sewer main installations shall have line and grade set prior to construction by survey, with a minimum of staking for each manhole with cuts to inverts of inlets and outlets. All mains are to be straight between manholes, unless specifically approved otherwise in writing by the City Engineer or shown as such on the approved plans.

The contractor may use any method such as “swede line and batter board” and “laser beam” etc., which would allow him to accurately transfer the control points provided by the surveyor in laying the pipe to the designated alignment and grade.

When using the “swede line and batter board” method, the contractor shall transfer line and grade into the ditch where they shall be carried by means of a taut grade line supported on firmly set batter boards at intervals of not more than 30 feet. Not less than three batter boards shall be in use at one time. Grades shall be constantly checked and in event the batter boards do not line up, the work shall be immediately stopped and the cause remedied before proceeding with the work.

When using a “laser beam” to set pipe alignment and grade, the contractor shall constantly check the position of laser beam from surface hubs provided by the surveyor to ensure the laser beam is still on alignment and grade. In the event the laser beam is found out of position, the contractor shall stop work and make necessary corrections to the laser beam equipment and pipe installed.

Clearances between sewer and water main pipe shall be a minimum of 10 feet.

#### **6-7.6 PLUGS AND CONNECTIONS**

All fittings shall be capped or plugged with a plug of an approved material gasketed with the same gasket material as the pipe unit; or shall be fitted with an approved mechanical stopper; or shall have an integrally cast knock-out plug. The plug shall be able to withstand all test pressures without leaking, and when later removed, shall permit continuation of piping with jointing similar to joints in the installed line.

#### **6-7.7 JOINTING**

Where it is necessary to break out or connect to an existing sewer during construction, only new pipe having the same inside diameter will be used in reconnecting the sewer. Where joints must be made between pipes with a mismatched wall thickness, the Contractor shall use flexible gasketed coupling, adaptor or coupling-adaptor to make a watertight joint. Couplings shall be those manufactured by

“Romac”, “Smith Blair”, or approved equal for reinforced pipes and “Fernco” or approved equal for non-reinforced pipes.

#### **6-7.8 JACKING, AUGURING OR TUNNELING**

See Section 3-9 Underground Utilities of these Specifications for Jacking, Auguring or Tunneling.

#### **6-7.9 SIZE**

The minimum pipe size for sanitary sewer mains shall be 8 inches in diameter. The Utility Superintendent shall determine the pipe size required to serve the surrounding area.

#### **6-7.10 SLOPE**

##### 8 inch Mains:

- A. 1% slope for the first two runs between manholes and a dead end line.
- B. .75% slope when the line is not covered under condition “A” above.
- C. Any slope less than condition “A” or “B” above must be approved by the Director of Public Works.

##### 10 inch Mains or Larger:

The minimum slope shall be such as to provide a minimum flow velocity of 2 feet/sec. (full), providing there are at least 100 lots upstream.

#### **6-7.11 SEPTIC TANKS**

Septic systems are generally not allowed within the city. Grinder pump system should be used before septic tank systems. In areas of the city where it is determined by the City Engineer that conventional gravity or grinder pump sanitary sewer service is not available and/or not practical to be served by a public sewer system in the future, septic tank systems may be installed upon approval by the Utilities and issuance of a permit by the Snohomish County Health District.

#### **6-7.12 PAVEMENT PATCHING**

For pavement patching see Section 3-14 and Standard Plan 316 of these Standards.

#### **6-7.13 CLEANING AND TESTING**

All sanitary sewer pipe installations shall be tested in accordance with Section 7-17.3(4) of the WSDOT/APWA Standard Specifications for Road, Bridge, and Municipal Construction. A copy of this testing procedure is included at the end of this Section. Sewers and appurtenance shall be cleaned and tested after backfilling by either the exfiltration or low pressure air method at the option of the contractor, except where the ground water table is such that the City Engineer may require the infiltration test.

The contractor/developer shall be required to clean and flush, with an approved cleaning ball and clean water, all gravity sanitary sewer lines prior to testing. The cleaning ball shall be an inflatable diagonally ribbed rubber ball of a size that will inflate to fit snugly into the pipe to be tested. A rope or chord will fastened to the ball to enable total control of the ball at all times.

## **6-8 SIDE SEWERS**

### **6-8.1 DESCRIPTION**

A side sewer is considered to be that portion of a sewer line that will be constructed between a main sewer line and a residence or other buildings in which the disposal of sanitary waste originates. It does not include any of the internal piping or connection appurtenances, the installation of which is controlled by a municipal code, ordinance or regulation.

The general requirements for construction of sewers in other Sections of these Specifications shall apply for construction of side sewers unless they are inconsistent with any of the provisions of this particular Section and the Specifications shall apply alike to all side sewers on public rights-of-way and private property.

### **6-8.2 MATERIALS**

Materials shall meet the requirements of Section 6-7 of these Specifications.

All pipe shall be clearly marked with type, class, and/or thickness, as applicable. Lettering shall be legible and permanent under normal conditions of handling and storage.

Approved jointing shall be flexible gasketing.

Flexible gasketing shall be construed to include rubber, synthetic rubberlike and plastic materials specially manufactured for the joint, pipe size, and use intended and shall be furnished by the manufacturer of the pipe to be used.

### **6-8.3 GENERAL**

Side sewer construction shall conform to Standard Plan Nos. 601, 602, and 604.

Side sewer locations shown on the drawings shall be subject to relocation in the field after construction starts. Regardless of the drawing location, the contractor shall place the tee or wye branch in the main sewer line at the location designated by the engineer.

A maximum of one residential unit or building will be allowed to connect to each side sewer. If the equivalent sewage flow from the building will be equal to more than 20 residential units, then a manhole will be required to be constructed at the connection to the sewer main.

Side sewers are not permitted to cross a public right-of-way or run parallel to the right-of-way centerline. All lots must front on a public sanitary system in order to be served.

Side sewers shall be replaced to the main at all new developments and remodels that require a sewer application unless otherwise approved by the Utility Superintendent.

### **6-8.4 EXCAVATION, BEDDING, BACKFILL AND COMPACTION**

Excavation, bedding, backfill and compaction for side sewers shall conform to the requirements of Section 3.0 Underground Utilities and to Standard Drawings 611 and 615. The bedding material shall be Crushed Surfacing Base Course conforming to Section 9-03.9(3) of the WSDOT/APWA Standard Specifications and to Section 3-20.5 of these Standards.

### **6-8.5 SIZE**

The minimum size requirement for that portion of any side sewer within any easement or public right-of-way is 6 inches in diameter.

On private property that portion of the side sewer may be reduced to 4 inches in diameter on single family homes, all other uses from duplexes to commercial must install 6 inch minimum in diameter piping to building connection.

### **6-8.6 SLOPE**

The minimum slope for side sewers shall be 2%.

### **6-8.7 FITTINGS**

All fittings shall be factory-produced and shall be designed for installation on the pipe to be used. Fittings shall be of the same quality and material as the pipe used, except when installing a PVC insert on existing pipe.

Side sewers shall be connected to the tee, wye, or riser provided in the public sewer where such is available, utilizing approved fittings or adapters. Where no tee, wye, or riser is provided or available, connection shall be made by core drilling and installing and approved tee. Tees shall be "Romac Industries, Style CG" or approved equal.

### **6-8.8 CLEANOUTS**

All side sewers shall have a 6 inch clean-out at the property line per Standard Plan No. 604. The riser portion of the clean-out shall be PVC unless otherwise approved by the Utility Superintendent. For longer side sewer installations, extra clean-outs will be required at spacings not to exceed 100 feet.

### **6-8.9 TESTING**

All side sewers shall be tested after backfill. Side sewers that are reconstructed or repaired to a length of 10 feet or more shall be tested for water tightness. Testing of newly reconstructed sections of side sewers consisting of a single length of pipe will not be required. Testing shall be performed in the presence of the engineer in accordance with Section 7-17.3(4) of the Standard Specifications for Road, Bridge and Municipal Construction. A copy of this testing procedure is at the end of this section.

When a new side sewer is installed, the entire length of new pipe installed shall be tested. In cases where a new tap is made on the main, the first joint of pipe off the main shall be installed with a test tee, so that an inflatable rubber ball can be inserted for sealing off the side sewer installation for testing. In cases where the side sewer stub is existing to the property line, the test ball may be inserted through the clean-out wye to test the new portion of the side sewer installation.

### **6-9 TELEVISION INSPECTION**

All new mains within the public right-of-way and those in easements to be maintained by the city will be subject to a visual inspection with a TV camera unit by the City Sewer Division. Any deficiencies noted by the TV camera inspection shall be corrected to the satisfaction of the Utilities Division. The initial inspection costs are borne by the city. Follow-up reinspection after correction of any deficiencies is billed on a direct cost bases.

## NOTES

1. SHAPE OF SEDIMENTATION POND MAY VARY TO FIT DRAINAGE AREA AND TERRAIN. MODIFY AS NECESSARY TO ENSURE SATISFACTORY TRAPPING OF SEDIMENT. HALF-CIRCLE POND MAY BE USED WHEN CURB AND GUTTER ARE INSTALLED DURING STREET CONSTRUCTION.
2. CLEAN OUT WHEN SEDIMENT REACHES 6" BELOW GRATE.
3. TEMPORARILY LEAVE OUT BLOCK. COVER OPENING WITH WIRE SCREEN. SIZE SCREEN TO RETAIN GRAVEL.
4. PLACE WASHED GRAVEL IN FRONT OF SCREEN TO FILTER SEDIMENT.
5. SIZE POND BASED ON EXPECTED FLOWS DURING CONSTRUCTION.
6. TO PREVENT SEDIMENTATION FROM ENTERING STORM DRAINAGE SYSTEM AT CATCH BASIN/INLETS DURING CONSTRUCTION.

**NOTES**

1. CATCH BASIN INSERTS SHALL BE REMOVED AT THE END OF THE PROJECT.
2. CATCH BASIN INSERTS ARE ONLY TO BE INSTALLED IN DRAINAGE DEVICES PER THE MANUFACTURER'S RECOMMENDATIONS. CATCH BASIN INLET INSERTS SHALL BE INSTALLED IN CURB INLETS.
3. CATCH BASIN INSERTS SHALL BE INSTALLED PRIOR TO CLEARING AND GRADING ACTIVITY, OR UPON PLACEMENT OF A NEW CATCH BASIN.
4. SEDIMENT SHALL BE REMOVED FROM THE UNIT WHEN IT BECOMES ONE THIRD FULL OR IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS.
5. SEDIMENT REMOVAL SHALL BE ACCOMPLISHED BY REMOVING THE INLET INSERTS, EMPTYING, AND RE-INSTALLING IT INTO THE CATCH BASIN. DO NOT WASH SEDIMENT INTO STORM DRAINS WHILE CLEANING.
6. SIZE THE BELOW INLET GRATE DEVICE (BIGD) FOR THE STORM WATER STRUCTURE IT WILL SERVICE.
7. THE BIGD SHALL HAVE A BUILT-IN HIGH-FLOW RELIEF SYSTEM (OVERFLOW BYPASS).
8. THE RETRIEVAL SYSTEM MUST ALLOW REMOVAL OF THE BIGD WITHOUT SPILLING THE COLLECTED MATERIAL.
9. PERFORM MAINTENANCE IN ACCORDANCE WITH STANDARD SPECIFICATION 8-01.3(15).

WSDOT STD PLAN I-40.20-00 ACCEPTABLE SUBSTITUTE IF MAINTENANCE MEETS NOTES 1-5

## NOTES

1. FOR ANY EASEMENT ACCESS OR EASEMENT WITH PUBLIC UTILITIES, THE CITY ENGINEER SHALL DETERMINE THE REQUIRED EASEMENT WIDTH BASED ON CITY STANDARDS.
2. WITH THE EXCEPTION OF THE EASEMENT ACCESS DRIVE, NO NEW DRIVEWAYS OR PARKING AREAS WILL BE PERMITTED WITHIN THE FRONT YARD SETBACK AREA FOR ALL LOTS THAT FRONT ON THE PUBLIC STREET.
3. ACCESS OFF AN EASEMENT DRIVE IS LIMITED TO ONE TWENTY FOOT DRIVEWAY AND CURB CUT PER LOT. THE DRIVEWAY SHALL NOT EXCEED TWENTY FEET IN WIDTH FOR A DISTANCE OF TWENTY FEET FROM THE EASEMENT ACCESS DRIVE CURB. THE MINIMUM PARKING STALL WIDTH FOR 2 CARS IN FRONT OF THE GARAGE IS 20 FEET BY 20 FEET - TWO (2) STALLS. THE MINIMUM PARKING PAD FOR 4 OFF-STREET IS 20 FEET BY 40 FEET.
4. SURFACE PARKING: EMC18.28.120 SURFACE PARKING IS ONLY PERMITTED ON A LOT WITH AN EXISTING HOUSE. THIS PARKING AREA MAY NOT BE BETWEEN THE EXISTING HOUSE AND THE PUBLIC STREET. THE PARKING PAD MUST BE A MINIMUM OF 20 FEET BY 40 FEET AND BE A MINIMUM OF 5 FEET FROM ANY NEW PROPERTY LINE AND MAY NOT BE WITHIN THE REQUIRED OPEN SPACE.
5. GARAGES: EMC 18.28.150 ON ALL NEW LOTS WHERE PROPOSED SINGLE FAMILY DWELLINGS ARE PROPOSED A TWO (2) CAR GARAGE IS REQUIRED.
6. EMC 18.28.120 ALL DEVELOPMENT STANDARDS FOR EASEMENT ACCESS DRIVES MUST BE MET.
7. ALL LOW IMPACT AREAS SHALL HAVE 'BIORETENTION SOIL' PER CURRENT EDITION OF "LOW IMPACT DEVELOPMENT TECHNICAL GUIDANCE MANUAL FOR PUGET SOUND"
8. 5' MIN SEPARATION BETWEEN CITY OPERATED UTILITIES AND OTHER PRIVATE AND PUBLIC OPERATED UTILITIES (PUD, CABLE TV, PHONE, GAS ETC.)
9. NON CITY OPERATED PUBLIC UTILITIES MAY CROSS CITY EXCLUSIVE EASEMENT ONLY BETWEEN 45° AND 90° WITH RIDGED STEEL CONDUIT OR PVC CONDUIT ENCASED IN RED CONCRETE WITH CITY ENGINEER APPROVAL.
10. CONDUIT DUCTING SHALL HAVE A MINIMUM COVER OF 3' AND NOT OBSTRUCT CROSSING BY OTHER UTILITIES FOR A VERTICAL DISTANCE GREATER THAN 3' IN EITHER EASEMENT.
11. ONLY CITY OPERATED UTILITIES SHALL BE ALLOWED WITHIN CITY EXCLUSIVE EASEMENT NO OTHER EASEMENTS MAY BE GRANTED WITHIN THE LIMITS OF THIS EASEMENT.

**TYPE A CURB & SW**

**MONOLITHIC CURB & SIDEWALK SECTION**

**TYPE E-1 CURB, PLANTER STRIP & SIDEWALK SECTION**

**MONOLITHIC CURB & SIDEWALK SECTION**

**NOTES**

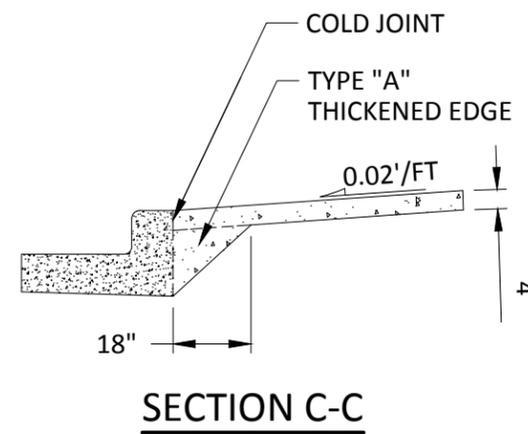

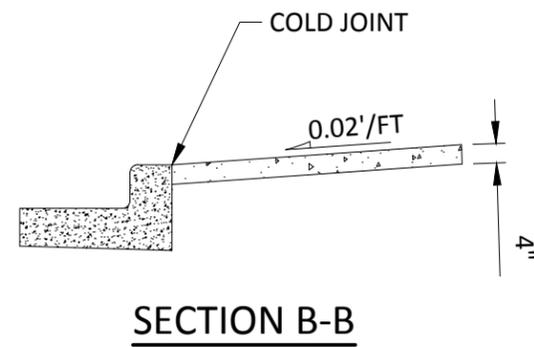

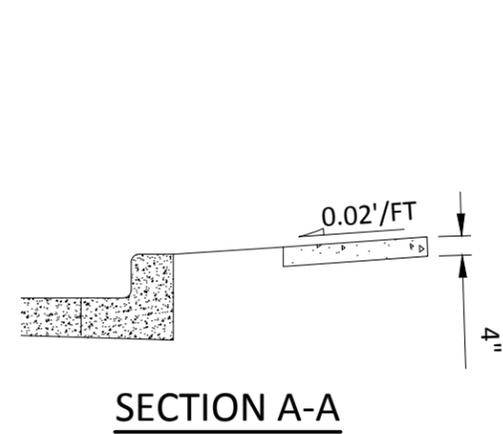

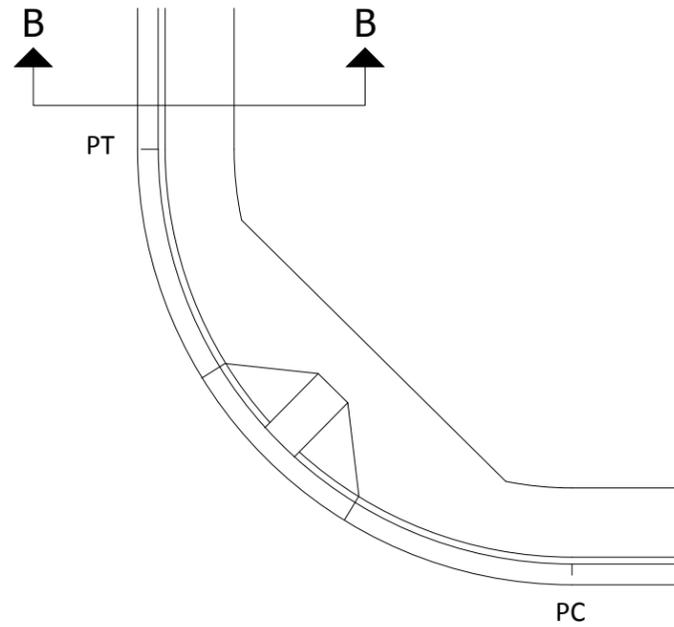

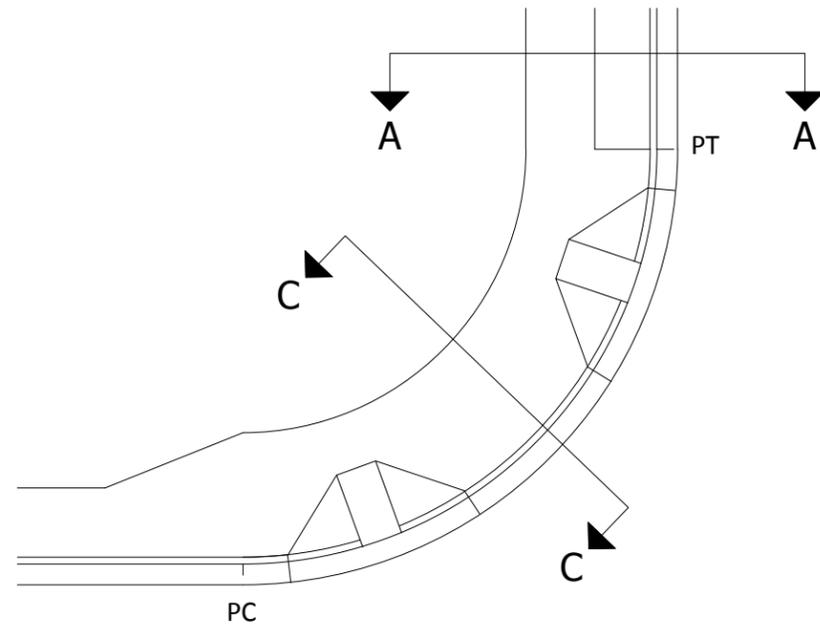

1. SIDEWALKS SHALL BE A MINIMUM OF 4" THICK, AND SHALL BE COMMERCIAL MIX CONCRETE AS CALLED OUT IN WSDOT STD SPECS., WITH AIR ENTRAINMENT (MIN 4.5 %, MAX 6.5 %).
2. SIDEWALK FULL DEPTH EXPANSION JOINTS SHALL GENERALLY BE PLACED TO MATCH THOSE IN ADJACENT CURB & GUTTER (WITHOUT PLANTER STRIP). MAXIMUM SPACING OF 30 FEET, FINAL SPACING DETERMINATION SHALL BE DECIDED BY THE INSPECTOR IN THE FIELD.
3. SUBGRADE SHALL BE COMPACTED TO NOT LESS THAN 95% OF MAXIMUM DENSITY.
4. SIDEWALK SHALL BE AT LEAST 6" THICK IN DRIVEWAYS AND BEHIND ROLL-CURB (STD 305B).
5. THE FINISHED SIDEWALK SHALL BE SPRAYED WITH A TRANSPARENT CURING COMPOUND COVERED BY WATERPROOF PAPER OR PLASTIC SHEETING IN THE EVENT OF RAIN OR OTHER INCLEMENT WEATHER. CURING TIME SHALL BE FOR A MINIMUM OF 72 HOURS.
6. ALL JOINTS SHALL BE CLEANED AND EDGED WITH AN EDGER HAVING A 3/8" RADIUS AFTER FINAL BROOM FINISH IS COMPLETED.
7. SIDEWALKS ARE 5' MIN. WIDE, EXCEPT 6' ALONG ARTERIALS, IN COMMERCIAL AREAS, OR AS APPROVED BY THE CITY ENGINEER.
8. CURB REVEAL MUST MATCH EXISTING TOP OF CURB FOR REPLACEMENT PROJECTS. THIS MEANS THAT THE FULL CURB IS PLACED IN AS SHOWN IN THE TYPICAL SECTION BUT THE ASPHALT STREET WILL COVER FACE OF CURB SO LESS THAN 6" MAYBE REVEALED.

**DRAFT**

**NOTES**

1. "V" GROOVES SHALL BE SPACED TO CORRESPOND TO THE MARKINGS IN EXISTING SIDEWALKS, OR AS DIRECTED BY THE ENGINEER.
2. ALL UTILITY POLES, METER BOXES AND OTHER OBSTRUCTIONS SHALL HAVE FULL DEPTH 3/8" EXPANSION JOINT MATERIAL PLACED AROUND THEM.
3. ALL SIDEWALK EDGES SHALL HAVE 1/2" RADIUS.
4. MINIMUM WIDTH OF SIDEWALK IS 5' (NOT INCLUDING THE WIDTH OF THE CURB).
5. THICKENED EDGES ARE REQUIRED FOR SIDEWALKS AT CORNERS, BUT NOT ON TANGENT SECTIONS. ALL CURB RAMPS SHALL HAVE A THICKENED EDGE TO THE DEPTH OF THE ADJACENT CURB, INCLUDING CURB RAMPS BUILT ON TANGENT SECTIONS OF SIDEWALK. MONOLITHIC CURB AND SIDEWALK CONFORMING TO STD DWG 306 DO NOT REQUIRE ADDITIONAL THICKENED EDGE.
6. FOR CURB RAMP DETAILS SEE STANDARD PLANS 310A, 310B AND 310C.

- DESIGNATES SIZE OF ROCK, I.E. 4 MAN. SEE NOTE 11.

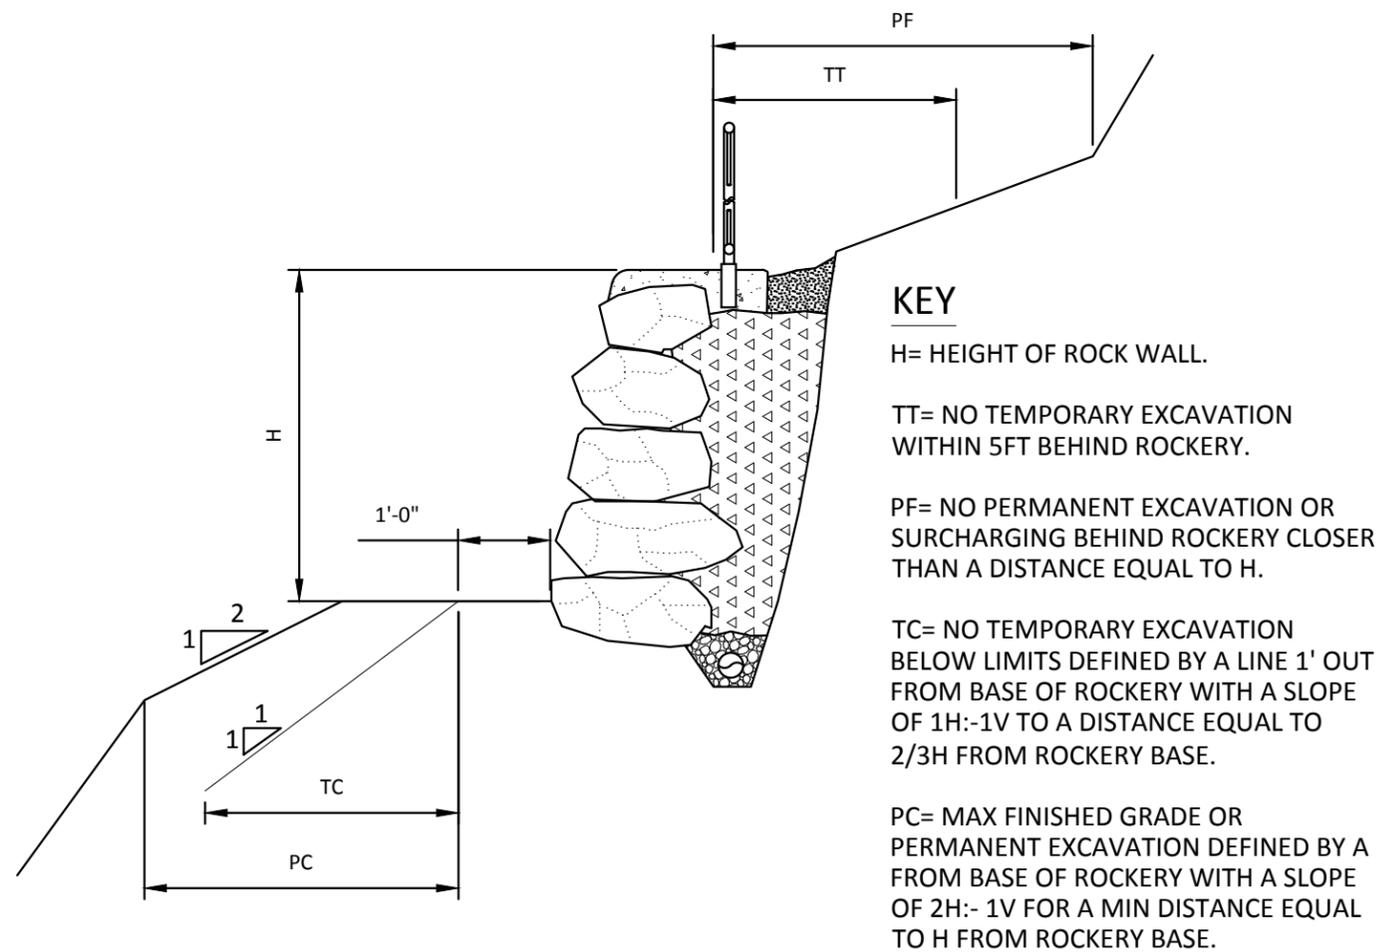

**NOTES**

1. MAXIMUM INCLINATION OF THE SLOPES ABOVE AND BEHIND ROCK WALL SHALL BE 2:1 (HORIZONTAL:VERTICAL)
2. MINIMUM THICKNESS OF ROCK FILTER LAYER B=12 INCHES. MINIMUM EMBEDMENT D=12 INCHES.
3. MAXIMUM ROCK WALL HEIGHT H=8 FEET. ROCK WALLS GREATER THAN 8 FEET IN HEIGHT SHALL BE DESIGNED BY A CIVIL ENGINEER LICENSED IN THE STATE OF WASHINGTON.
4. ROCK SHALL BE PLACED TO GRADUALLY DECREASE IN SIZE WITH INCREASING WALL HEIGHT.
5. MINIMUM WIDTH OF KEYWAY EXCAVATION W, SHALL BE EQUAL TO THE THICKNESS OF THE BASE ROCK PLUS B (ROCK FILTER)
6. THE LONG DIMENSION OF THE ROCKS SHALL EXTEND BACK TOWARDS THE CUT OR FILL FACE TO PROVIDE MAXIMUM STABILITY.
7. WHENEVER POSSIBLE EACH ROCK SHALL BEAR ON TWO OR MORE ROCKS BELOW IT, WITH GOOD FLAT-TO-FLAT CONTACT.
8. WHERE VOIDS OF GREATER THAN 6 INCHES IN DIMENSIONS EXIST IN THE ROCK FACE AND THERE IS NO ROCK CONTACT WITHIN THE ROCK WALL THICKNESS, THE VOID SHALL BE CHINKED WITH SMALL PIECES OF ROCK.
9. ROCKERIES WHICH ARE MORE THAN 30 INCHES ABOVE GRADE OR FLOOR BELOW SHALL BE PROTECTED BY GUARDRAIL SUCH AS A ORNAMENTAL OR PEDESTRIAN RAIL. TYPE TO BE DETERMINED BY THE CITY ENGINEER, SEE DWGS 325 & 326
10. FOR DESIGN LOCATION AND UNDERGROUND UTILITY LIMITATIONS REFER TO STD DWG 324B.
11. THE DENSITY OF ROCK MATERIAL SHALL BE A MINIMUM OF 155 PCF. THE SIZE CATEGORIES FOR ROCK SHALL BE AS FOLLOWS:

SIZE	APPROXIMATE WEIGHT - LBS	APPROXIMATE DIAMETER-INCHES
1 MAN	50-200	12-18
2 MAN	200-700	18-28
3 MAN	700-2000	28-36
4 MAN	2000-4000	36-48
5 MAN	4000-6000	48-54
6 MAN	6000-8000	54-60

**PLACEMENT NOTES**

1. ALL NEW ROCKERY DESIGN AND PLACEMENT WILL FOLLOW TO CONSTRUCTION LIMITATIONS DESCRIBE ABOVE, AND FOLLOW THE GUIDELINES ESTABLISHED BY THE ASSOCIATED ROCKERY CONTRACTORS "STANDARD ROCK WALL CONSTRUCTION GUIDELINES" DATED 12/2/92 INCLUDING ANY AND ALL REVISIONS.
2. MODIFICATIONS TO OR PLACEMENT OF SUBSEQUENT UNDERGROUND UTILITIES WILL ALSO FOLLOW LIMITATIONS DESCRIBED ABOVE.

**KEY**

- H= HEIGHT OF ROCK WALL.
- TT= NO TEMPORARY EXCAVATION WITHIN 5FT BEHIND ROCKERY.
- PF= NO PERMANENT EXCAVATION OR SURCHARGING BEHIND ROCKERY CLOSER THAN A DISTANCE EQUAL TO H.
- TC= NO TEMPORARY EXCAVATION BELOW LIMITS DEFINED BY A LINE 1' OUT FROM BASE OF ROCKERY WITH A SLOPE OF 1H:-1V TO A DISTANCE EQUAL TO 2/3H FROM ROCKERY BASE.
- PC= MAX FINISHED GRADE OR PERMANENT EXCAVATION DEFINED BY A FROM BASE OF ROCKERY WITH A SLOPE OF 2H:- 1V FOR A MIN DISTANCE EQUAL TO H FROM ROCKERY BASE.

DESIGN, CONSTRUCTION REQUIREMENTS, PLACEMENT & POST CONSTRUCTION LIMITS				<b>332</b>

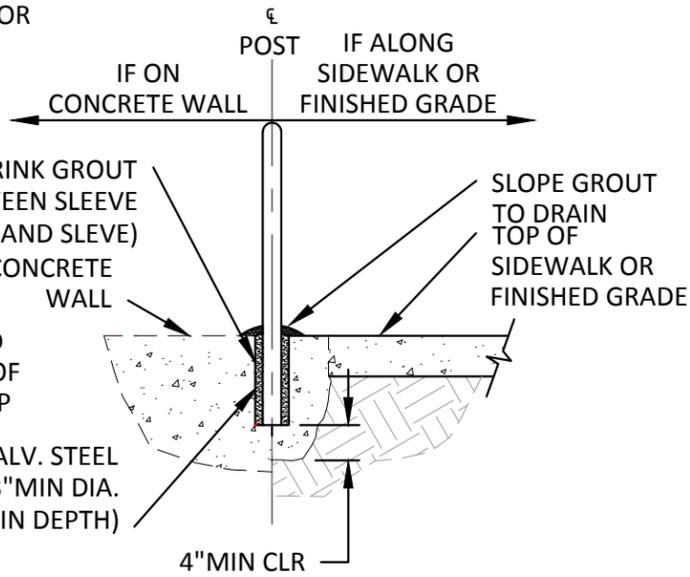

**ELEVATION**

**SLIP JOINT & RAIL CONNECTIONS TO POSTS**

**DETAIL A**

**POST MOUNTING**

**DETAIL B**

**NOTES**

1. MATERIAL FOR PEDESTRIAN HANDRAIL SHALL BE ALUMINUM (ASTM B-429) OR GALVANIZED STEEL (ASTM 120) AS APPROVED BY THE CITY ENGINEER.
2. SEE SHEET 2 OF 2 THIS DRAWING FOR ADDITIONAL FABRICATION AND SPECIFICATION REQUIREMENTS.
3. PROVIDE SLIP JOINTS AT STAIRWAY EXPANSION JOINTS AND AT EVERY 24 FEET ON CENTER MAXIMUM.

**ALUMINUM PEDESTRIAN RAIL NOTES**

1. ALUMINUM PEDESTRIAN RAIL SHALL BE FABRICATED AND INSTALLED IN ACCORDANCE WITH THESE SPECIAL PROVISIONS AND THIS DRAWING.
2. ALUMINUM PEDESTRIAN RAIL SHALL BE NATURAL ALUMINUM COLOR.
3. COMPLETED ALUMINUM RAILING UNITS SHALL BE ANODIZED AFTER FABRICATION CONFORMING TO THE REQUIREMENTS OF THE ALUMINUM ASSOCIATION STANDARD FOR ANODIZED ARCHITECTURAL ALUMINUM, CLASS I ANODIC COATING, AA-C22-A41.
4. WELDING SHALL CONFORM TO THE REQUIREMENTS OF THE "SPECIFICATIONS FOR ALUMINUM STRUCTURES" OF THE ALUMINUM ASSOCIATION. ALL EXPOSED WELDS SHALL BE GROUND FLUSH WITH ADJACENT SURFACES.
5. THE BASE METAL FOR ALUMINUM RAILING SHALL BE ASA ALLOY DESIGNATION 6063-T6. PIPE AND TUBING SHALL BE EXTRUDED CONFORMING TO THE REQUIREMENTS OF ASTM B 429, PLATES AND SHEETS SHALL BE ROLLED CONFORMING TO ASTM B 209, AND RODS, BARS OR SHAPES SHALL BE EXTRUDED CONFORMING TO ASTM B 221.
6. HORIZONTAL RAILS AND VERTICAL SUPPORT POSTS SHALL BE 1 1/2 INCH DIAMETER STANDARD ALUMINUM PIPE AND BALUSTERS SHALL BE 3/4 INCH DIAMETER STANDARD ALUMINUM PIPE. RAILS, POSTS, AND BALUSTERS SHALL BE MACHINE CUT TO PROVIDE A UNIFORM LENGTH PRIOR TO ASSEMBLY.
7. RAILING SHALL BE ERECTED AND ADJUSTED, IF NECESSARY, TO ASSURE A CONTINUOUS LINE AND GRADE.

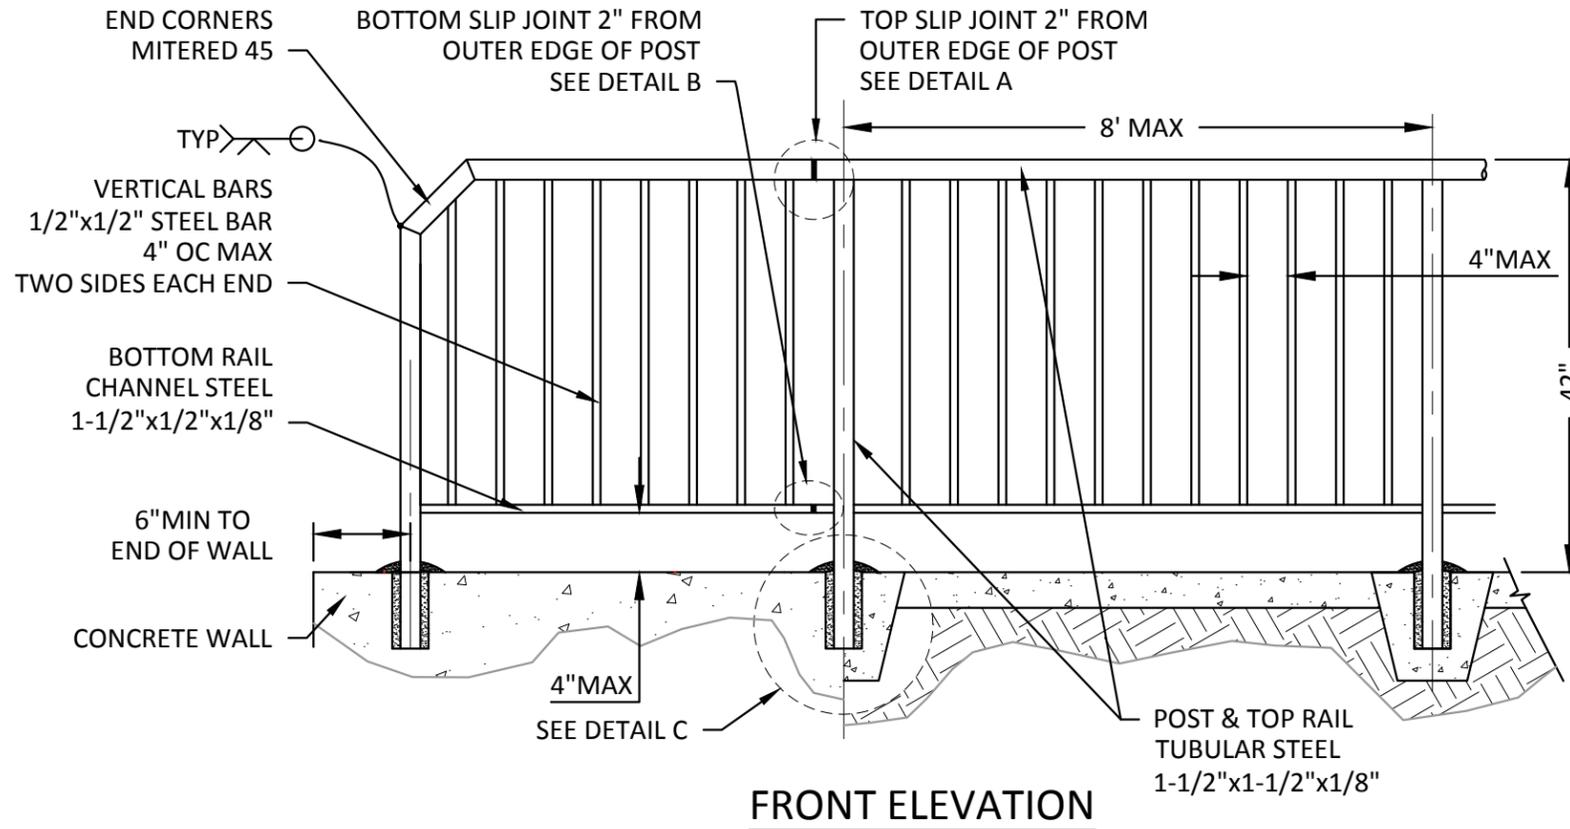

**GALVANIZED STEEL PEDESTRIAN RAIL NOTES**

1. GALVANIZED PEDESTRIAN RAIL SHALL BE FABRICATED AND INSTALLED IN ACCORDANCE WITH THESE SPECIAL PROVISIONS AND THIS DRAWING.
2. STEEL RAILINGS MATERIALS SHALL BE WELDED OR SEAMLESS STEEL PIPE CONFORMING TO THE REQUIREMENTS OF ASTM A 53, STRUCTURAL STEEL CONFORMING TO ASTM A 36, OR TUBULAR SECTIONS OF HOT ROLLED MILD STEEL, CONFORMING TO ASTM A 501. ALL WELDING SHALL CONFORM TO AMERICAN WELDING SOCIETY STRUCTURAL WELDING CODE AWS D1.1. AFTER FABRICATION EACH SECTION OF RAILING SHALL BE HOT-DIPPED GALVANIZED WITH A MINIMUM ZINC COATING OF 2 OUNCES PER SQUARE FOOT. ALL BURRS AND SHARP EDGES SHALL BE REMOVED PRIOR TO GALVANIZING.
3. FIELD WELDS SHALL BE GALVANIZED WITH SUCH MATERIALS AS "GALVALLOY" OR "GALVICON". PAINTING OF WELDS WILL NOT BE PERMITTED.
4. HORIZONTAL RAILS AND VERTICAL SUPPORT POSTS SHALL BE BE 1 1/2 INCH DIAMETER AND BALUSTERS SHALL BE 3/4 INCH DIAMETER STANDARD WEIGHT GALVANIZED STEEL PIPE. RAILS, POSTS AND BALUSTERS SHALL BE MACHINE CUT TO PROVIDE A UNIFORM LENGTH PRIOR TO ASSEMBLY.
5. RAILING SHALL BE ERECTED AND ADJUSTED, IF NECESSARY, TO ASSURE A CONTINUOUS LINE AND GRADE.

**DRAFT**

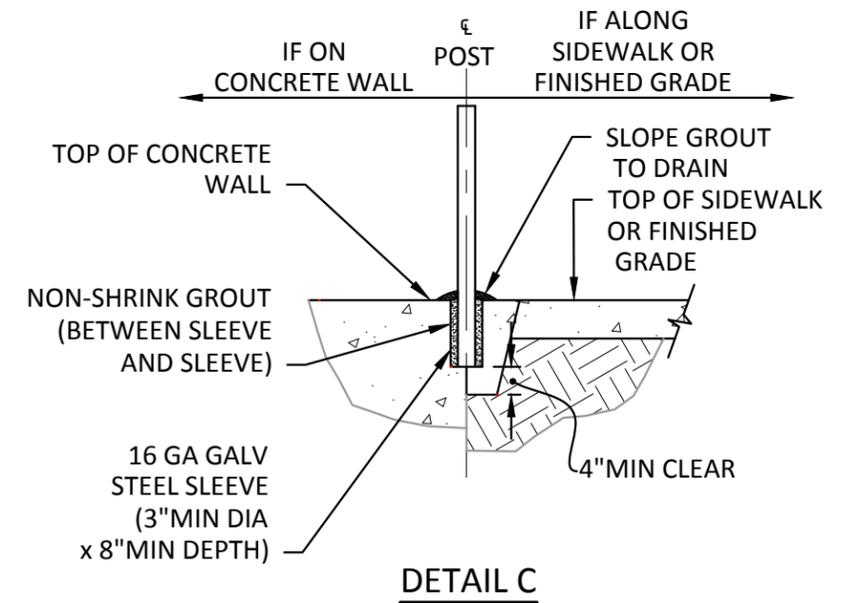

**NOTES**

1. ORNAMENTAL RAILING SHALL BE CONSTRUCTED OF STEEL CONFORMING TO ASTM A-53.
2. WELDING SHALL CONFORM TO THE REQUIREMENTS OF THE "STRUCTURAL WELDING CODE" AWS D 1.1.
3. PROVIDE SLIP JOINTS AT STAIRWAY EXPANSION JOINTS AND AT EVERY 24 FEET ON CENTER MAXIMUM.
4. MAXIMUM SPACING OF POSTS SHALL BE 8 FEET ON STRAIGHT ALIGNMENT AND 6 FEET ON CURVED ALIGNMENT LESS THAN 30 FEET RADIUS.
5. AFTER FABRICATION, ALL BURRS AND SHARP EDGES SHALL BE REMOVED.
6. APPLY RUST PROOF METAL PRIMER AND ONE COAT OF BLACK ORNAMENTAL IRON METAL PAINT.

# **NOTES**

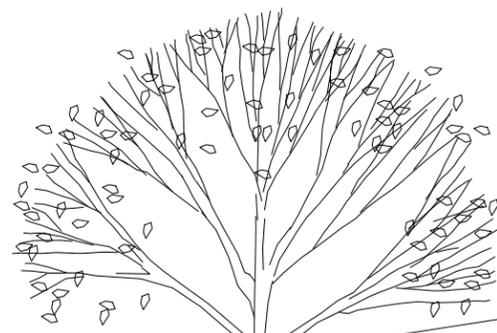

1. APPROVED EVERETT SMALL OR MEDIUM TREE SPECIES.
2. PLASTIC TREE STRAPS (1/2" WIDE). UPPER TIES 3" MIN (6" MAX) FROM TOP OF STAKE. IF UPPER TIE IS MORE THAN 4' ABOVE FINISHED GROUND, LOCATE LOWER TIES MIDPOINT UPPER TIE AND FINISHED GRADE. TOP STRAP SHALL BE A MIN. OF 1/3 OF THE TREE HEIGHT.
3. TWO STAKES MIN. 2"X2"X8' CEDAR/DOUGLAS FIR OR 2"X8' ROUND POLES. POUND 1' MIN. INTO UNDISTURBED OR CONSTRUCTED SOIL. TRIPLE STAKE DECIDUOUS TREES LARGER THAN 2" CALIPER.
4. PLACE ROOT BALL ON 6" MIN COMPACTED TOPSOIL MIX.
5. REMOVE TOP 1/3 OF BURLAP AND WIRE BASKET, REMOVE ALL TIES.
6. 2" MIN BARK MULCH OVER ALL PLANTED AREAS.
7. MINIMUM ROOT SPREAD TO BE IN ACCORDANCE WITH "AMERICAN STANDARDS FOR NURSERY STOCK". PRUNE ALL DAMAGED, DISEASED OR WEAK ROOTS. DO NOT ALLOW ROOTS TO DRY OUT DURING INSTALLATION PROCESS. SOAK ROOTS IN WATER OVERNIGHT BEFORE PLANTING ANY BARE ROOT STOCK.
8. SHRUBS AND TREES SHALL BE SLIGHTLY HIGHER IN RELATIONSHIP TO THE OLD SOIL MARK ON THE TRUNK AND THE FINISHED GRADE OF THE PLANTING.
9. CREATE SAUCER WITH TOPSOIL (6"R MIN.)
10. IF NECESSARY, THIN BRANCHES BY 1/8 RETAINING NORMAL PLANT SHAPE
11. GENTLY COMPACTED PLANTING MIX (AS SPECIFIED).
12. ALL GROUND COVER/SHRUB SPACING SHALL BE EQUIDISTANT UNLESS OTHERWISE SPECIFIED. DISTANCE ON CENTER AS SPECIFIED 'E'. SPACING BETWEEN ROWS 'D' AS SPECIFIED. START FIRST ROW OF PLANTING AT 1/2 'D' FROM PLANTING BORDER.
13. UNDISTURBED NATIVE SOIL OR CONSTRUCTED SOIL.

\* CORRUGATED POLYETHYLENE STORM SEWER PIPE

**NOTES**

- AS ACCEPTABLE ALTERNATIVES TO THE REBAR SHOWN IN THE PRECAST BASE SECTION, FIBERS (PLACED ACCORDING TO THE WSDOT STANDARD SPECIFICATIONS), OR WIRE MESH HAVING A MINIMUM AREA OF 0.12 SQUARE INCHES PER FOOT SHALL BE USED WITH THE MINIMUM REQUIRED REBAR SHOWN IN THE ALTERNATIVE PRECAST BASE SECTION. WIRE MESH SHALL NOT BE PLACED IN THE KNOCKOUTS.
- THE KNOCKOUT DIAMETER SHALL NOT BE GREATER THAN 18". KNOCKOUTS SHALL HAVE A WALL THICKNESS OF 2" MINIMUM TO 2.5" MAXIMUM. PROVIDE A 1.5" MINIMUM GAP BETWEEN THE KNOCKOUT WALL AND THE OUTSIDE OF THE PIPE. AFTER THE PIPE IS INSTALLED, FILL THE GAP WITH JOINT MORTAR IN ACCORDANCE WITH WSDOT STANDARD SPECIFICATION 9-04.3.
- THE MAXIMUM DEPTH FROM THE FINISHED GRADE TO THE LOWEST PIPE INVERT SHALL BE 5'.
- THE FRAME AND GRATE MAY BE INSTALLED WITH THE FLANGE DOWN, OR INTEGRALLY CAST INTO THE ADJUSTMENT SECTION WITH FLANGE UP.
- THE PRECAST BASE SECTION MAY HAVE A ROUNDED FLOOR, AND THE WALLS MAY BE SLOPED AT A RATE OF 1:24 OR STEEPER.
- THE OPENING SHALL BE MEASURED AT THE TOP OF THE PRECAST BASE SECTION.
- ALL PICKUP HOLES SHALL BE GROUTED FULL AFTER THE BASIN HAS BEEN PLACED.

### NOTES

1. NO STEPS ARE REQUIRED WHEN HEIGHT IS 4' OR LESS.
2. THE BOTTOM OF THE PRECAST CATCH BASIN MAY BE SLOPED TO FACILITATE CLEANING.
3. THE RECTANGULAR FRAME AND GRATE MAY BE INSTALLED WITH THE FLANGE UP OR DOWN. THE FRAME MAY BE CAST INTO THE ADJUSTMENT SECTION.
4. KNOCKOUTS SHALL HAVE A WALL THICKNESS OF 2" MINIMUM TO 2.5" MAXIMUM. PROVIDE A 1.5" MINIMUM GAP BETWEEN THE KNOCKOUT WALL AND THE OUTSIDE OF THE PIPE. AFTER THE PIPE IS INSTALLED, FILL THE GAP WITH JOINT MORTAR IN ACCORDANCE WITH WSDOT STANDARD SPECIFICATION 9-04.3.
5. CONCRETE STRUCTURE SHALL MEET THE REQUIREMENTS OF AASHTO M199.
6. FOR MANHOLE COVER SEE STANDARD DRAWING 607A AND 607B. REFER TO DESIGN AND CONSTRUCTION STANDARDS AND SPECIFICATIONS SECTION 4 FOR ADDITIONAL REQUIREMENTS.
7. STEPS PER STANDARD DRAWING 606.

411

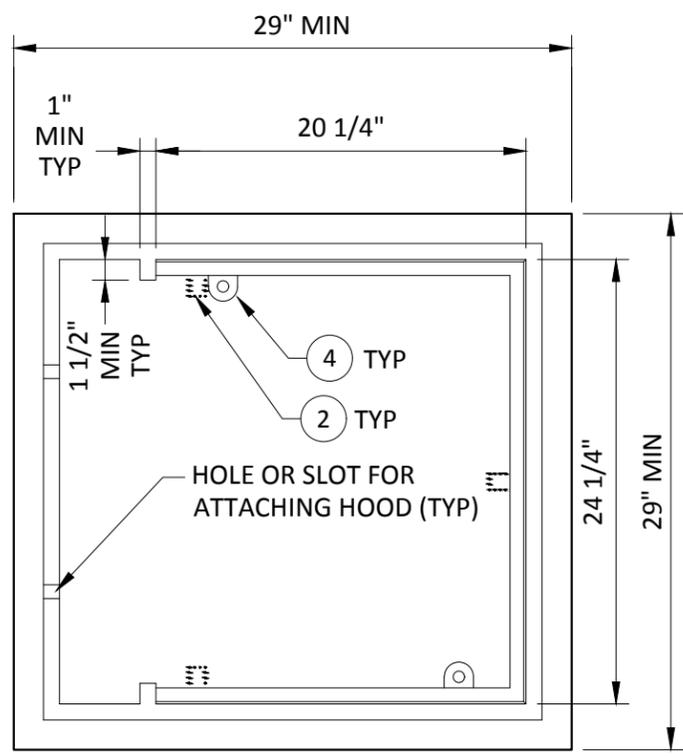

**DRAFT**

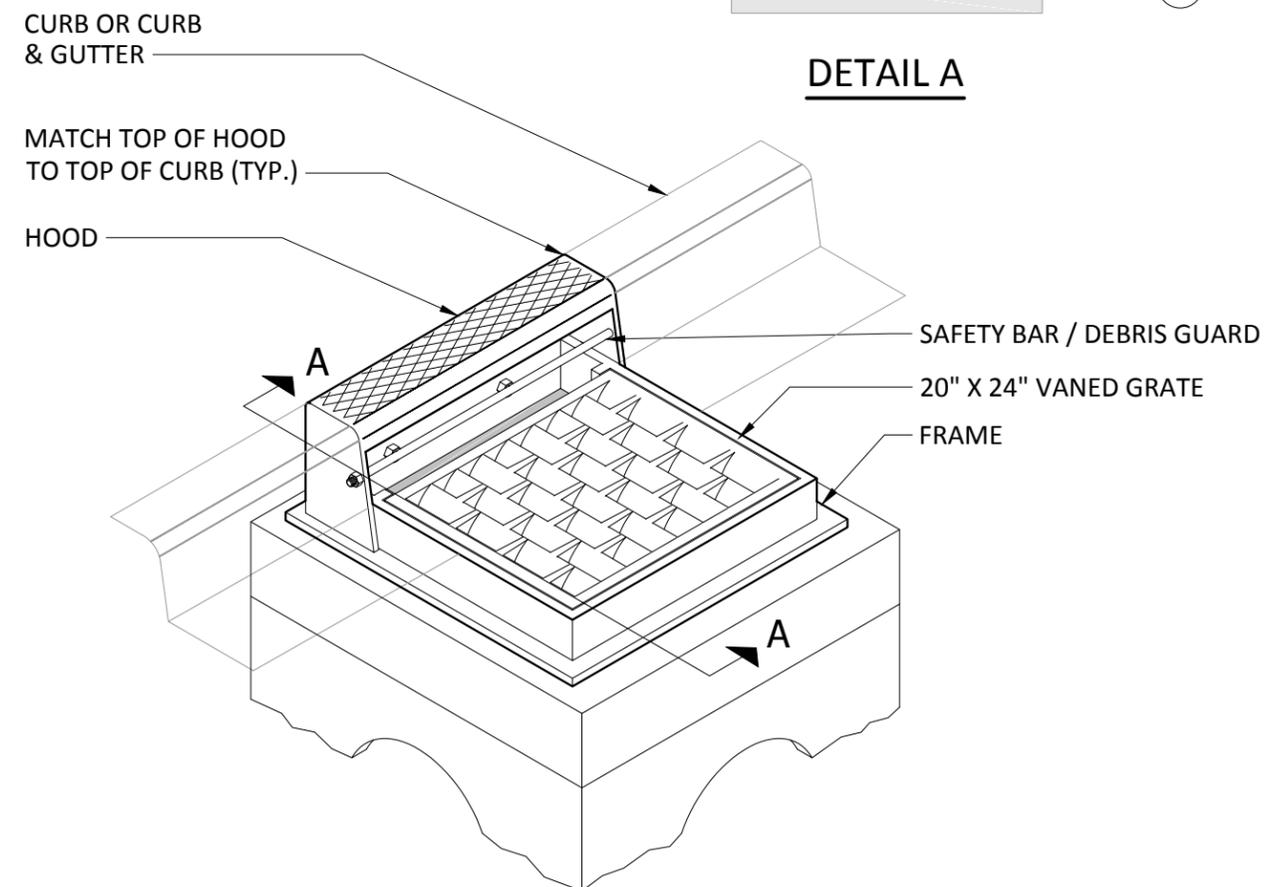

**SECTION A-A**

**DETAIL A**

**TOP VIEW FRAME DETAIL**

**ISOMETRIC VIEW COMBINATION INLET FRAME, HOOD, AND VANED GRATE**

**NOTES**

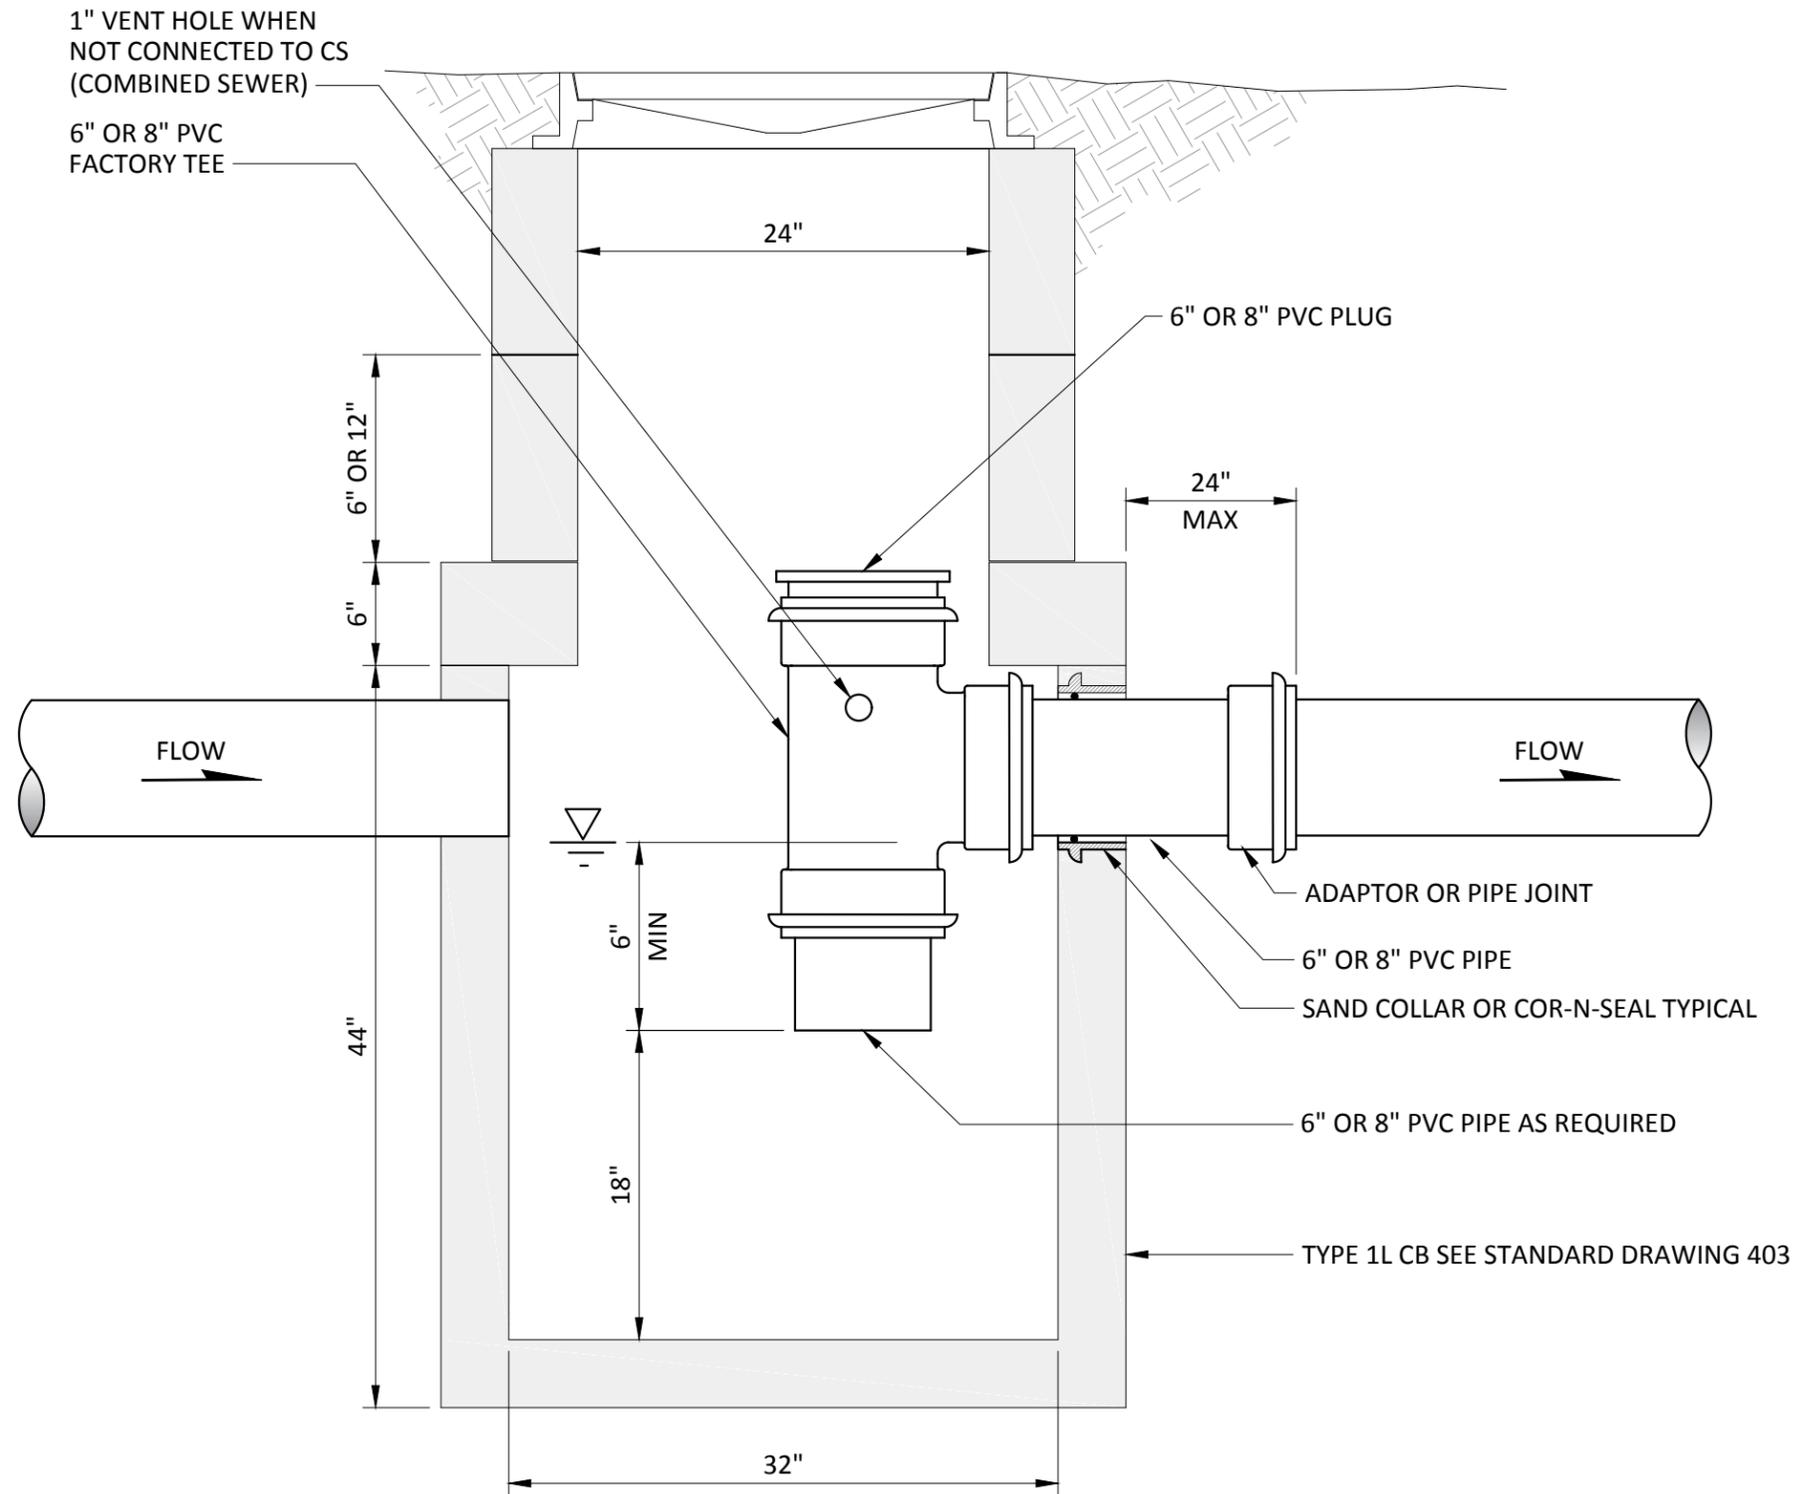

1. THIS INLET REQUIRES THE PRECAST CATCH BASIN UNIT TO BE ROTATED 90 DEGREES SO THAT THE NARROW SIDE IS PARALLEL TO THE CURB LINE. WHEN CALCULATING OFFSETS FROM CURB TO CENTERLINE OF THE PRECAST CATCH BASIN, PLEASE NOTE THAT THE CENTERLINE OF THE GRATE IS NOT THE CENTERLINE OF THE PRECAST CATCH BASIN. SEE SECTION A.
2. THE DIMENSIONS OF THE FRAME AND HOOD MAY VARY SLIGHTLY AMONG DIFFERENT MANUFACTURERS. THE FRAME MAY HAVE CAST FEATURES INTENDED TO SUPPORT A DEBRIS GUARD. HOOD UNITS MAY BE MOUNTED INSIDE OR OUTSIDE OF THE FRAME. THE METHODS FOR FASTENING THE SAFETY BAR / DEBRIS GUARD TO THE HOOD MAY VARY. THE HOOD MAY INCLUDE CASTING LUGS. THE TOP OF THE HOOD MAY BE CAST WITH A PATTERN.
3. ATTACH THE HOOD TO THE FRAME WITH TWO 3/4" x 2" STAINLESS STEEL HEX HEAD BOLTS, NUTS, AND OVERSIZE WASHERS. THE WASHERS SHALL HAVE DIAMETERS ADEQUATE TO ENSURE FULL BEARING ACROSS THE SLOTS.
4. BOLT-DOWN CAPABILITY IS REQUIRED ON ALL FRAMES, GRATES AND COVERS, UNLESS SPECIFIED IN THE CONTRACT. PROVIDE TWO HOLES IN THE FRAME THAT ARE VERTICALLY ALIGNED WITH THE GRATE SLOTS. THE FRAME SHALL ACCEPT THE 5/8" - 11 NC x 2" STAINLESS STEEL ALLEN HEAD CAP SCREW BY BEING TAPPED, OR OTHER APPROVED MECHANISM. THE LOCATION OF BOLT-DOWN HOLES VARIES AMONG DIFFERENT MANUFACTURERS. SEE BOLT-DOWN DETAIL, STANDARD DRAWING 406.
5. ONLY DUCTILE IRON VANED GRATES SHALL BE USED. SEE STANDARD DRAWING 411 FOR GRATE DETAILS. REFER TO WSDOT STANDARD SPECIFICATION 9-05.15(2) AND DESIGN CONSTRUCTION STANDARDS AND SPECIFICATIONS SECTION 4 FOR ADDITIONAL REQUIREMENTS.
6. THIS PLAN IS INTENDED TO SHOW THE INSTALLATION DETAILS OF A MANUFACTURED PRODUCT. THIS PLAN IS NOT INTENDED TO SHOW THE SPECIFIC DETAILS NECESSARY TO FABRICATE THE CASTINGS DEPICTED IN THIS DRAWING.

**INFILTRATION RAIN GARDEN**

**NOTES**

**DESIGN:**

1. SEE THE RAIN GARDEN HANDBOOK FOR WESTERN WASHINGTON FOR DESIGN AND PLANTING INSTRUCTIONS. NATIVE PLANTS ARE PREFERRED, BECAUSE NON-NATIVE AND INVASIVE SPECIES CAN MOVE DOWNSTREAM AND DAMAGE HABITAT. IF NON-NATIVES ARE CHOSEN, BE SURE THAT THEY WILL NOT DAMAGE DOWNSTREAM HABITAT.
2. RAIN GARDENS MAY BE USED TO MEET STORMWATER MINIMUM REQUIREMENT #5 FOR SITES WHICH ADD OR REPLACE LESS THAN 5000 SF OF NEW OR REPLACED HARD SURFACE.
3. PROVIDE RAIN GARDEN INFORMATIVE SIGNS FOR RAIN GARDEN ASSOCIATED WITH NEW CONSTRUCTION. SIGNS ARE AVAILABLE FROM PERMIT SERVICES.
4. MAINTENANCE AGREEMENTS ARE REQUIRED FOR RAIN GARDEN INSTALLATION USED TO MEET STORMWATER MINIMUM REQUIREMENTS.

**CONSTRUCTION:**

1. BUILD AND VEGETATE RAIN GARDEN AS EARLY AS POSSIBLE TO ESTABLISH PLANTINGS BEFORE DIRECTING STORMWATER RUNOFF TO IT.
2. INFILTRATION AREAS (THE AREA OF THE RAIN GARDEN AS DEFINED BY THE TOP ELEVATION OF THE FACILITY) SHALL BE FENCED OFF FROM THE FIRST DAY OF EARTH MOVING UNTIL PROJECT COMPLETION TO PREVENT COMPACTION OF THE SUBGRADE, DIRT TRACKING ONTO ANY LAYER OF THE FACILITY AND STOCKPILING OF CONSTRUCTION MATERIALS THAT MAY CLOG THE SURFACE.
3. DURING EXCAVATION OF NATIVE SOILS TO THE BOTTOM OF THE FACILITY, RAINFALL MAY CAUSE FINES TO CLOG THE SURFACE OF THE FACILITY. IF THE NATIVE SOIL HAS BEEN EXPOSED TO RAINFALL, HAND RAKE THE SURFACE TO A DEPTH OF 3" TO RESTORE INFILTRATION CAPACITY.
4. DURING AREA DRAIN INSTALLATION, DISTURB NATIVE SOILS AS LITTLE AS POSSIBLE.

RAIN GARDEN WITH UNDERDRAIN			12/30/2016
			STANDARD DRAWING No.
			427

## NOTES

1. FOR ALL PONDS WITHOUT AN INTERNAL BERM ONLY A SINGLE ACCESS RAMP IS REQUIRED. EXTEND ACCESS ROAD MATERIAL ALONG THE ENTIRE LENGTH OF THE POND BOTTOM.
2. SEE TEXT FOR ROAD SURFACING MATERIAL REQUIREMENTS.
3. REFER TO THE CITY OF EVERETT STORMWATER MANAGEMENT MANUAL FOR ADDITIONAL DESIGN REQUIREMENTS.

## NOTES

- PERMEABLE PAVEMENT WITHIN CITY RIGHT-OF-WAY REQUIRES APPROVAL BY THE CITY ENGINEER WHEN PLACED BENEATH A TRAVELED WAY. THESE GUIDELINES PROVIDE A MINIMUM DEPTH FOR THE HYDROLOGIC PERFORMANCE OF THE PERMEABLE PAVEMENT. THE STRUCTURAL CAPACITY OF PAVEMENT SECTIONS WHEN SUBJECT TO VEHICULAR LOADS DEPENDS ON SEVERAL FACTORS AND MUST BE DESIGNED BY A LICENSED PROFESSIONAL ENGINEER.
- LONGITUDINAL SLOPE, 0 TO 5% MAX. FOR PERMEABLE ASPHALT, 8% MAX. FOR PERMEABLE CONCRETE.
- USE CHECK DAM OR OTHER METHODS TO MAXIMIZE PONDING IN THE SUBSURFACE FOR LONGITUDINAL SLOPES EXCEEDING 2%. SEE STANDARD DRAWING 431.
- LEVELING COURSE MATERIALS: 1.5" TO U.S. NO. 8 UNIFORMLY GRADED, CRUSHED (ANGULAR), THOROUGHLY WASHED STONE.
- GEOTEXTILE SHALL BE PROVIDED BETWEEN RUNOFF TREATMENT LAYER OR NATIVE SOIL AND PERMEABLE BALLAST WHEN RECOMMENDED BY GEOTECHNICAL PROFESSIONAL OR PAVEMENT DESIGNER. GEOTEXTILE SHALL BE PROVIDED WHEN FINES IN NATIVE SUBGRADE EXCEED 7% ON THE #200 SIEVE. GEOTEXTILE SHALL BE PLACED BETWEEN PERMEABLE BALLAST AND TREATMENT LAYER IF A TREATMENT LAYER IS USED. GEOTEXTILE SHALL BE GEOTEXTILE FOR SEPARATION PER WSDOT/APWA STANDARD SPECIFICATION 9-33.2, NON WOVEN, TABLE 3.
- PERMEABLE CONCRETE MUST BE INSTALLED BY A CERTIFIED PERMEABLE CONCRETE INSTALLER. PERMEABLE ASPHALT MUST BE INSTALLED BY AN EXPERIENCED PERMEABLE ASPHALT INSTALLER.
- RUNOFF TREATMENT LAYER SHALL BE REQUIRED FOR PAVEMENT WHICH IS SUBJECT TO VEHICULAR TRAFFIC OR OTHER POLLUTANTS WHERE NATIVE SOILS DO NOT MEET THE REQUIREMENTS FOR TREATMENT. SEE THE STORMWATER MANAGEMENT MANUAL.
- SUBGRADE SHALL BE COMPACTED TO A FIRM AND UN YIELDING CONDITION IN ACCORDANCE WITH THE PROJECT PAVEMENT DESIGN. DO NOT OVER COMPACT SUBGRADE. HEAVY TRUCK AND CONSTRUCTION EQUIPMENT SHALL BE PROHIBITED FROM DRIVING ON THE SUBGRADE THROUGH OUT CONSTRUCTION.

## NOTES

- A. ROMAC, FORD OR MUELLER DOUBLE STRAP SERVICE SADDLE WITH I.P. THREAD TO BE USED ON ALL MAINS 4" DIA AND LARGER. ALL NEW TAPS ON EXISTING WATER MAINS SHALL BE DONE BY THE CITY OF EVERETT UTILITIES DEPARTMENT AT THE DEVELOPERS OR CONTRACTORS EXPENSE.
- B. 2" BRASS NIPPLE.
- C. HEAVY DUTY 2" GATE VALVE WITH RESILIENT SEAT AND 2" OPERATING NUT. GATE VALVES SHALL BE "WATEROUS" SERIES 2500 OR CITY APPROVED EQUAL.
- D. MUELLER H-15451N OR H-15428N OR APPROVED EQUAL. USE APPROPRIATE STAINLESS STEEL INSERT STIFFENER WITH POLYETHYLENE TUBING. PHYSICAL BENDS IN POLY PIPE ARE NOT ALLOWED, USE BRASS ELBOWS.
- E. RESIDENTIAL SERVICE
  - 1. PROVIDE 2" POLYETHYLENE TUBING MEETING THE FOLLOWING REQUIREMENTS:
    - a. AWWA C901.
    - b. ASTM D2737, SIDR 9 (pe3608/4710).
    - c. ASTM 3350 - PE3608 OR PE4710.
  - 2. PROVIDE A #10 AWG, SINGLE STRAND COPPER WIRE WITH BLUE TYPE UF OR USE COATING SUITABLE FOR DIRECT BURY.
    - a. WRAP WIRE AROUND TUBING, ONE WRAP PER FT, ITS ENTIRE LENGTH.
    - b. SECURE ONE END AROUND THE SADDLE BOLT BETWEEN TWO NUTS AND EXPOSE A MINIMUM OF 18" OF THE OTHER END IN THE METER BOX.
- F. NON-RESIDENTIAL SERVICE
  - 1. PROVIDE 2" TYPE K COPPER TUBING MEETING ASTM B88, ANSI/NSF 61 & APPLICABLE IAPMO STANDARDS.
- G. BRASS ELBOWS & NIPPLES AS NEEDED.
- H. METER SETTERS SHALL BE "FORD" 70 SERIES COPPER SETTER VBH77-12B-11-77 WITH HORIZONTAL INLET AND OUTLET OR APPROVED EQUAL.
- I. METER SHALL BE SUPPLIED AND INSTALLED BY CITY UTILITIES DEPARTMENT AT THE DEVELOPERS OR CONTRACTORS EXPENSE.
- J. PROVIDE METER BOX BODY MANUFACTURED BY "RAVEN PRODUCTS, MODEL RMB-17-30-12", MOUSEHOLES CUT, WITH AASTHO H-20 RATED DUCTILE IRON FLUSH SOLID COVER LID OR EQUAL.
- K. PLACE SAWDUST IN METER BOX AROUND PIPE TO TOP OF METER TO PREVENT FREEZING.
- L. ADJUSTABLE VALVE BOX AND EXTENSION SEE STD 505.

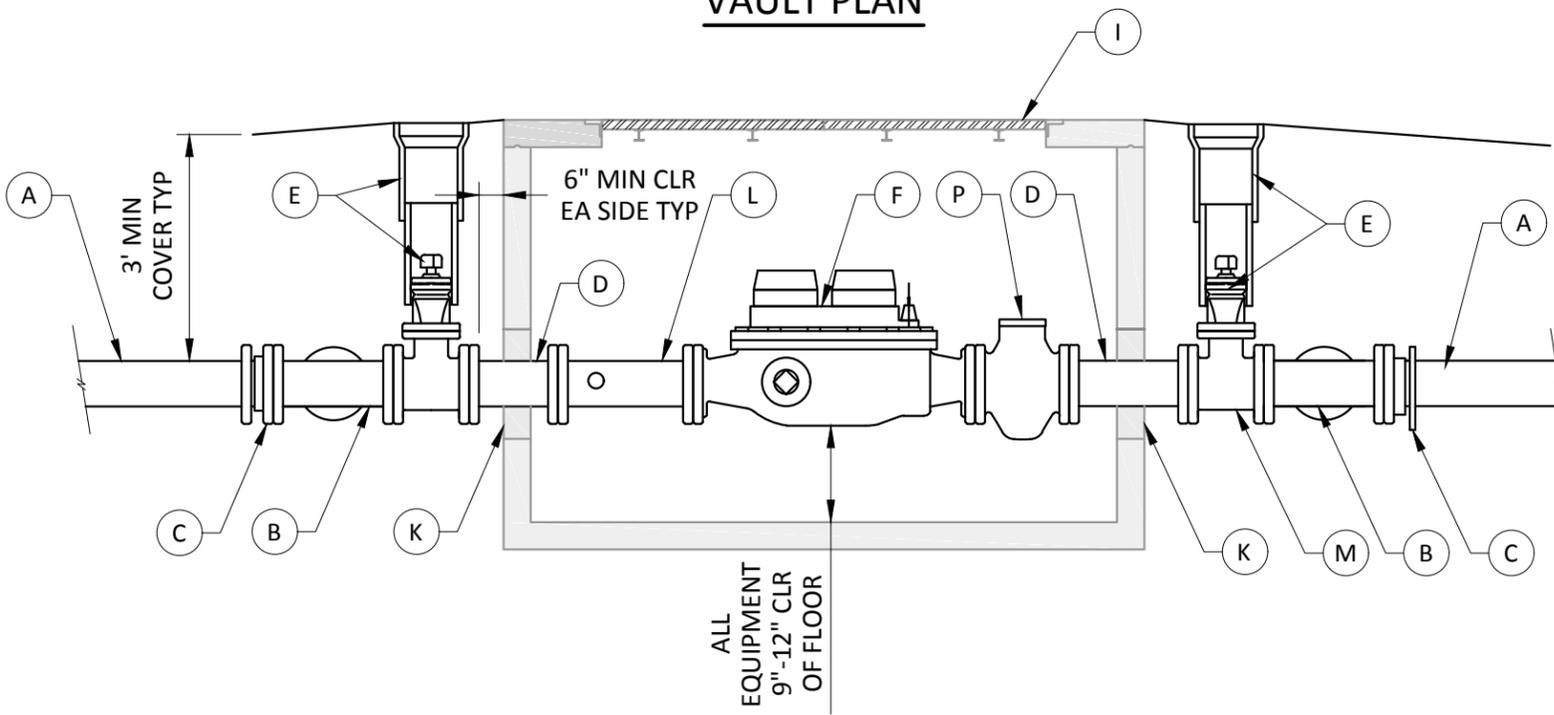

**2" METERED WATER SERVICE**

**VAULT PLAN**

**SECTION A-A**

**NOTES**

1. CONTRACTOR SHALL INSTALL VAULT, BYPASS, AND STRAIGHT PIPE THRU VAULT. CITY UTILITIES DEPARTMENT SHALL PROVIDE AND INSTALL ALL FITTINGS AND APPURTENANCES WITHIN THE VAULT INCLUDING METER, VALVES AND SPOOLS AT THE DEVELOPERS OR CONTRACTORS EXPENSE.
2. CITY OF EVERETT WILL SUPPLY AND INSTALL METER AND NOTES "L", IF NEEDED, & "P".
3. PIPING AND VALVES SHALL BE SUPPORTED BY STEEL STANDS. THE NUMBER OF AND PLACEMENT OF SUPPORT STANDS TO BE DETERMINED BY CITY OF EVERETT UTILITIES DEPARTMENT ACCORDING TO SIZE OF PIPE AND METER.
4. VALVES SHALL HAVE A MINIMUM CLEARANCE OF 3" BETWEEN OPERATING NUT AND TOP OF VAULT.
5. VAULTS SHALL NOT BE INSTALLED IN AREAS WITH VEHICULAR TRAFFIC.
6. GATE VALVES SHALL BE "WATEROUS" SERIES 2500 OR CITY APPROVED EQUAL.
7. INSTALLATION OF COMPOUND METERS LARGER THAN 8" SHALL BE APPROVED BY THE CITY ON AN INDIVIDUAL BASIS.

## NOTES

1. VALVE OPERATING NUT EXTENSIONS ARE REQUIRED WHEN THE VALVE NUT IS MORE THAN THREE (3) FEET BELOW FINISHED GRADE. EXTENSIONS ARE TO BE A MINIMUM OF ONE (1) FOOT LONG. ONLY ONE EXTENSION WILL BE ALLOWED PER VALVE.
2. ALL VALVE OPERATING NUT EXTENSIONS ARE TO BE MADE OF STEEL, SIZED AS NOTED, AND PAINTED WITH TWO (2) COATS OF METAL PAINT.
3. VALVE BOXES IN PAVED AREAS SHALL BE #940 STYLE CAST IRON, TWO PIECE UNITS, DESIGNED WITH LUGS ON COVER AND DEEP SKIRT. IN GRASS, NON-PAVED OR NON-TRAFFIC AREAS USE OF PLASTIC VALVE BOXES, WITH CAST IRON LID AS MANUFACTURED BY HANDLEY INDUSTRIES ARE ACCEPTABLE.
4. USE OF PLASTIC VALVE BOX EXTENSIONS, AS MANUFACTURED BY HANDLEY INDUSTRIES ARE ACCEPTABLE.

## PARTS

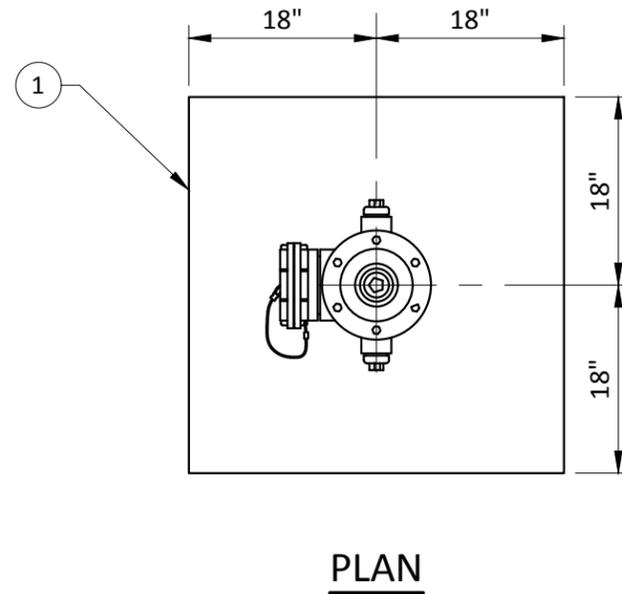

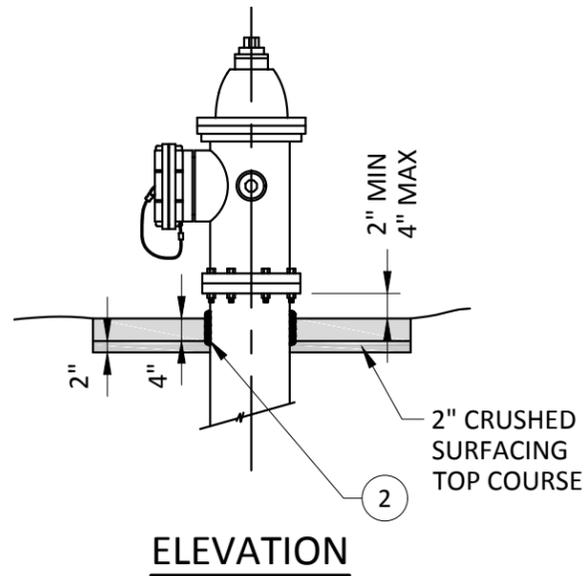

- A. HYDRANTS AND ALL MATERIALS SHALL CONFORM TO AWWA STANDARDS AND SHALL BE OF STANDARD MANUFACTURE (MUELLER SUPER CENTURION #250, WATEROUS PACER #WB67, OR CITY APPROVED EQUAL).
- B. 5-1/4" VALVE MINIMUM.
- C. 1-1/4" OPERATING NUT AND CAP NUT FOR 2-1/2" PORTS.
- D. NATIONAL STANDARD THREAD ON 2-1/2" PORTS.
- E. 5" STORZ FITTING WITH NATIONAL STANDARD THREAD ON THE 4-1/2" PORT.
- F. IF HYDRANT RISES THROUGH CONCRETE, USE EXPANSION STRIP AROUND HYDRANT BARREL, PER STD PLAN 509. IN ADDITION, INSTALLATION OF THE HYDRANT ON PRIVATE PROPERTY SHALL EQUAL OR EXCEED THE STANDARDS FOR INSTALLATION OF PUBLIC FIRE HYDRANTS IN THE CITY OF EVERETT.
- G. PROVIDE FOR VEHICULAR TRAFFIC PROTECTION WHEN NECESSARY PER STD. PLAN 508.
- H. STEAMER PORT TO BE FACING STREET OR ROADWAY FOR FIRE ENGINE ACCESS.
- I. BREAK-OFF FLANGE TO BE 2"-4" ABOVE GROUND LEVEL.
- J. INSTALL CONCRETE PAD AROUND HYDRANT IN UNPAVED, SOD AND ASPHALT AREAS PER STD. PLAN 508.
- K. HYDRANT CONNECTION PIPE TO BE DUCTILE IRON CLASS 52, ANY INTERMEDIATE JOINTS TO BE MJ WITH RETAINER GLANDS, OR FIELD LOCK GASKETS.
- L. FIRE HYDRANTS SHALL BE PAINTED WITH TWO COATS OF HIGH GLOSS CATERPILLAR YELLOW, LUXLITE #6100-516 OR "RUST-OLEUM" #7448 OR APPROVED EQUAL. THE PORT CAPS WILL BE PAINTED BLACK.
- M. PROVIDE FOR A MINIMUM OF 3' CLEAR ZONE AROUND HYDRANT.

FIRE HYDRANT INSTALLATION			STANDARD DRAWING No. 507

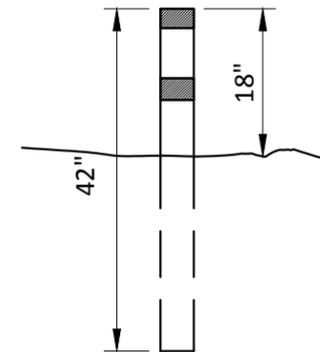

**FIRE HYDRANT CONCRETE PAD**  
(SEE NOTES 1 AND 2)

**NOTES**

1. CONCRETE SHALL BE CLASS 3000.
2. INSTALL 1/2"x4" EXPANSION STRIP AROUND HYDRANT.
3. GUARD POSTS SHALL BE 6' LONG, 9" IN DIAMETER PRECAST CONCRETE OR 6' LONG, 6" DIAM SCH 40, CONCRETE FILLED CLASS 52 STEEL PIPE. PAINTED WITH TWO COATS OF KELLY-MOORE LUXLITE Q.D. ALKYD GLOSS ENAMEL #6100-516 CAT YELLOW OR CITY APPROVED EQUAL.
4. TOP OF GUARD POST SHALL BE LEVEL WITH TOP OF PUMPER PORT.
5. VALVE MARKER POST SHALL BE 42" PORTABLE TRAFFIC DELINEATOR POST W/TWO REFLECTOR STRIPS. THEY SHALL BE FURNISHED NEW AND UNUSED AND BURIED 24" DEEP, TO LEAVE 18" EXPOSED AS A MARKER POST THE LETTER "V" AND THE DISTANCE TO THE VALVE SHALL BE STENCILED ON THE POST WITH 2" HIGH NUMERALS, WITH BLACK ENAMEL PAINT.
6. VALVE MARKER POSTS SHALL BE INSTALLED FOR ALL VALVES LOCATED IN UNIMPROVED OR UNPAVED AREAS. VALVE MARKER POSTS SHALL BE SET AS DIRECTED BY THE PUBLIC WORKS INSPECTOR IN A SAFE AND REASONABLY CONSPICUOUS LOCATION.
7. VALVE MARKER POSTS ARE NOT REQUIRED FOR AUXILIARY HYDRANT VALVES.

**FIRE HYDRANT GUARD POSTS**  
(SEE NOTES 3 AND 4)

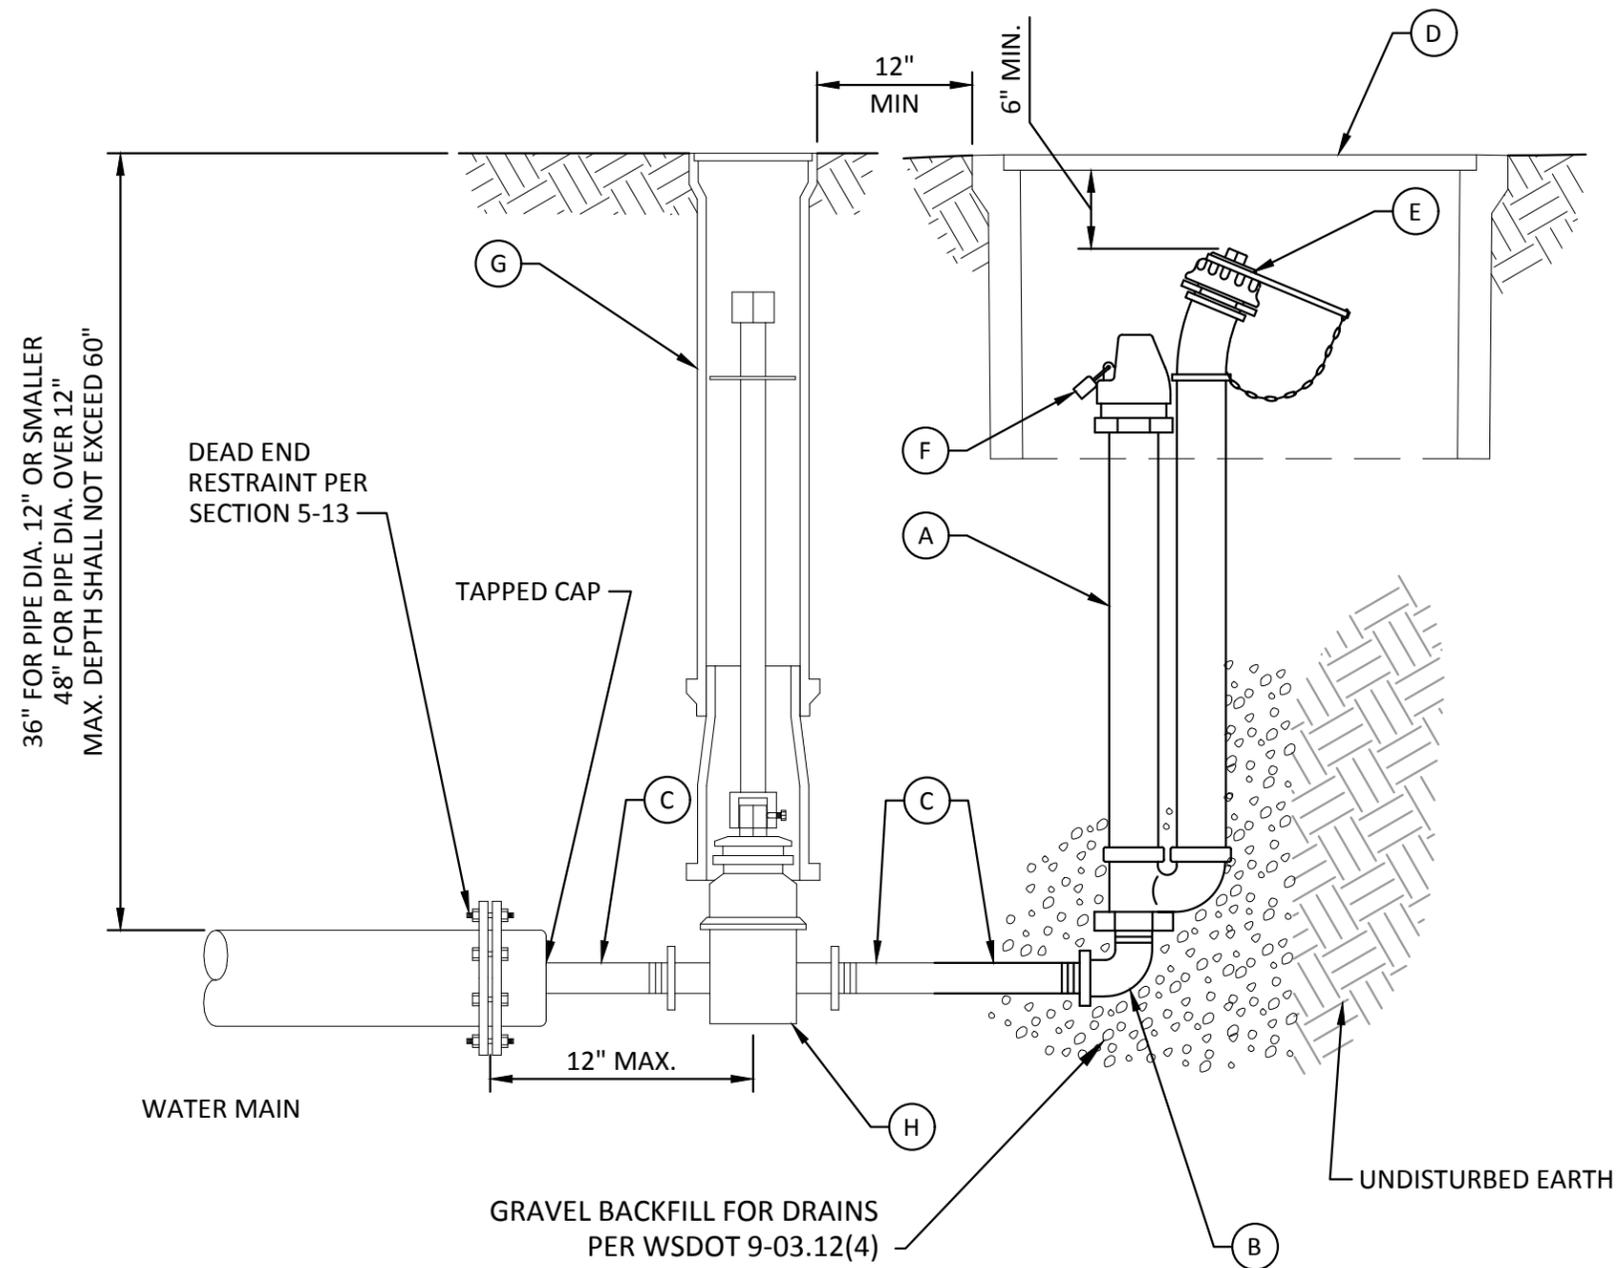

**VALVE MARKER POST**  
(SEE NOTES 5, 6 AND 7)

2. ALL TEST COCKS MUST HAVE BRASS PLUGS.
3. MAXIMUM HEIGHT OF ASSEMBLY IS FIVE FEET UNLESS AN OSHA APPROVED PLATFORM IS PROVIDED.
4. MINIMUM INSIDE VAULT HEIGHT IS 78", OR AS APPROVED BY THE CITY UTILITIES DEPARTMENT.
5. METER SHALL BE INSTALLED SUCH THAT IT CAN BE READ WITHOUT ENTERING VAULT WITH ACCESS HATCH OPEN AND WITHOUT ENTERING THE VAULT.
6. ALL DIMENSIONS ARE MINIMUM CLEARANCE REQUIREMENTS.
7. ASSEMBLY REQUIRES CERTIFICATION UPON INSTALLATION AND RECERTIFICATION ANNUALLY BY OWNER.

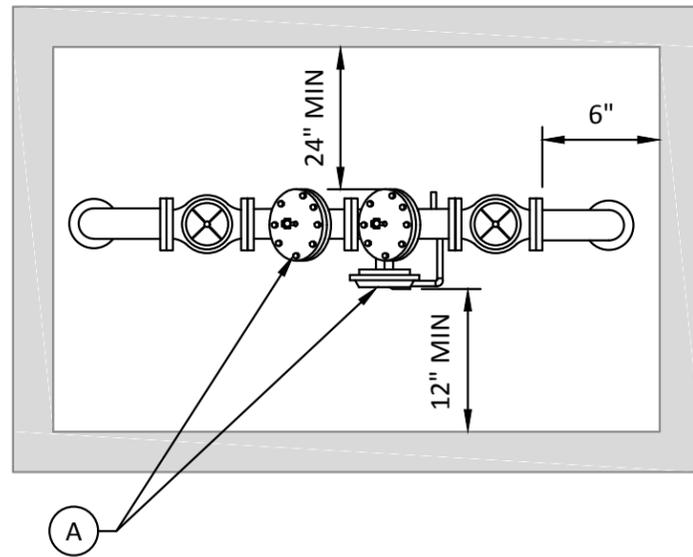

**PARTS**

- A. UL-FM LISTED SOFTSEATED WA STATE APPROVED REDUCED PRESSURE BACKFLOW ASSEMBLY INCLUDING: 2-O.S.& Y RESILIENT SEATED GATE VALVES, AND TEST COCKS.
- B. UNI-FLANGE WITH SET SCREWS OR MJ x FL ADAPTOR WITH MEGALUG OR GALVANIZED SHACKLE TO MAIN WITH 2-3/4" RODS, OR MJ RETAINER GLANDS.
- C. PRECAST CONCRETE ENCLOSURE WITH STEEL ACCESS HATCH (AS MANUFACTURED BY UTILITY VAULT CO OR AN APPROVED EQUAL). ABOVE GROUND INSTALLATIONS WILL: BE PROVIDED WITH 6'-6"x36" STEEL DOOR FOR ACCESS, THE EXTERIOR WILL BE PAINTED WITH AN APPROVED PAINT, PROVIDED WITH SUFFICIENT INSULATION TO PREVENT FREEZING AND SITE WILL BE PROVIDED WITH A 6' HIGH SECURITY FENCE WITH PEDESTRIAN AND VEHICLE GATES. SEMI-BURIED INSTALLATIONS WILL: BE PROVIDED WITH OSHA APPROVED LADDER. INSTALLED IN SUCH A WAY AS TO NOT INTERFERE WITH INSTALLED EQUIPMENT MAINTENANCE. PROVIDE NON-SLIP SURFACE ON ACCESS HATCH IF VAULT LOCATED IN PEDESTRIAN WALKWAY.
- D. DUCTILE IRON PIPE (SIZED AS REQUIRED) CLASS 52.
- E. WATER TIGHT GROUT SHALL BE USED IN ALL VAULT PENETRATIONS.
- F. 2 - GALVANIZED ADJUSTABLE PIPE SUPPORTS FOR 2 1/2" DIA AND LARGER PIPE.
- G. GRAVEL FOUNDATION AS REQUIRED.
- H. DRAIN SHALL BE INSTALLED WITH APPROVED AIR GAP (SEE STD 519) AND BE ABLE TO BE BORE SIGHTED TO DAYLIGHT WHICH MUST BE ABOVE 100 YEAR FLOOD LEVEL. DRAIN WILL BE SIZED SO AS TO PROVIDE FREE GRAVITY DRAINAGE OF MAX DISCHARGE OF RELIEF VALVE PORT.
- I. 3" MIN CLEARANCE FROM UNDERSIDE OF VAULT LID TO STEM OF OS&Y WHEN FULLY OPEN.

<b>REDUCED PRESSURE BACKFLOW ASSEMBLY (RPBA) ALL SIZES</b>				<b>518</b>

**DRAFT**

**NOTES**

1. ALL INSTALLED AIR GAPS MUST BE WA DOH APPROVED.
2. THE HEIGHT OF THE AIR GAP MUST MEET THE CRITERIA IN TABLE A UNLESS OTHERWISE NOTED.
3. THE CITY UTILITIES DEPARTMENT MAY REQUIRE THE AIR GAP TO BE INCREASED IF INSTALLED WITHIN A BUILDING WHERE THE AIR PRESSURE IS ARTIFICIALLY MAINTAINED OR INCREASED.
4. AIR GAPS LESS THAN 1 INCH SHALL BE APPROVED ONLY AS A PART OF A LISTED DEVICE THAT HAS BEEN TESTED UNDER BACKSIPHONAGE CONDITIONS WITHIN A VACUUM OF A MINIMUM OF 25 INCHES OF MERCURY.
5. TUBULAR SCREENS MAY BE ATTACHED OR THE SUPPLY LINE OUTLET MAY BE CUT AT A 45° ANGLE.
6. HOSES AND BYPASSES ARE NOT ALLOWED.
7. THE INSPECTION OF AIR GAPS SHALL BE INCLUDED IN THE YEARLY TESTING PROGRAM FOR BACKFLOW DEVICES.

D	AIR GAP (INCHES)	
	IF W > 3D	IF W ≤ 3D (SINGLE WALL) OR IF W ≤ 4D (INTERSECTING WALLS)
< 0.5 INCH	1	1.5
< 0.75 INCH	1.5	2.25
≥ 1 INCH	2 X D	3 X D

<b>TYPICAL PRESSURE REDUCING VALVE (PRV) INSTALLATION</b>				<b>521</b>

**PLAN**

**ELEVATION**

**PARTS**

- A. UL-FM LISTED SOFT SEATED WA STATE APPROVED DOUBLE CHECK DETECTOR VALVE ASSEMBLY WHICH MUST BE INSTALLED IN THE SAME ORIENTATION FOR WHICH IT WAS APPROVED. ASSEMBLY TO INCLUDE; TEST COCKS, 3/4" BRASS OR COPPER BYPASS WITH IN-LINE VALVES AND A 5/8" REMOTE METER. METER TO READ IN CUBIC FEET, AND BE REMOTED TO AN EXTERNAL WALL OF BUILDING METER BOX.
- B. UNI-FLANGE WITH SET SCREWS OR MJ x FL ADAPTER WITH MEGALUG RESTRAINT FOR BOTH UPSTREAM AND DOWNSTREAM OF ASSEMBLY.
- C. DUCTILE IRON PIPE (SIZED AS REQUIRED) CLASS 52.
- D. TWO GALVANIZED ADJUSTABLE PIPE SUPPORTS FOR 2 1/2" DIA AND LARGER PIPE.
- E. A SUFFICIENTLY SIZED FLOOR DRAIN OR WALL FOOTING DRAIN MUST BE PROVIDED IN THE SAME ROOM. DRAIN TO SLOPE TO DAYLIGHT OR CONNECT TO STORM DRAIN SYSTEM.
- F. EXTERNAL DOOR WITH KEY IS REQUIRED. EITHER A LOCKSET IN THE DOOR HARDWARE OR A KEY VAULT (I.E. SUPRA S.S.) WITH A 1 5/8" DIAMETER X 1 1/8" LENGTH MORTISE CYLINDER. MORTISE CYLINDER MUST ACCEPT THE CITY STANDARD "BEST" LOCKING SYSTEM. THE WIDTH AND HEIGHT OF THE DOOR(S) MUST EXCEED THE WIDTH AND HEIGHT OF THE ASSEMBLY. CLEARANCE BOTH INSIDE AND OUTSIDE ROOM MUST BE SUFFICIENT TO REMOVE ASSEMBLY INTACT. THE ASSEMBLY MUST BE FULLY ACCESSIBLE (2FT MIN HORIZONTAL CLEARANCE TO ALL WALLS AND OR EQUIPMENT) FOR TESTING AND REPAIRS.
- G. FLUSHING CAPABILITIES MUST BE PROVIDED WITH A 2" FLUSHING LINE DOWNSTREAM OF ASSEMBLY TO OUTSIDE OR SUFFICIENTLY SIZED INTERNAL DRAIN.
- H. WHERE ASSEMBLY IS TO BE LOCATED ABOVE EXTERNAL GROUND LEVEL, ALL BENDS REQUIRED TO LOWER INLET PIPE TO PROVIDE REQUIRED EXTERNAL GROUND COVER SHALL BE FLANGE FITTINGS OR BE FITTED WITH HORIZONTAL AND VERTICAL THRUST RESTRAINTS.
- I. THE ROOM SHOULD BE INSULATED WITH R-19 INSULATION OR GREATER AND HEATED TO ABOVE FREEZING. ONLY CONSTRUCTION MATERIALS THAT CAN WITHSTAND OCCASIONAL SUBMERSION WILL BE ALLOWED.

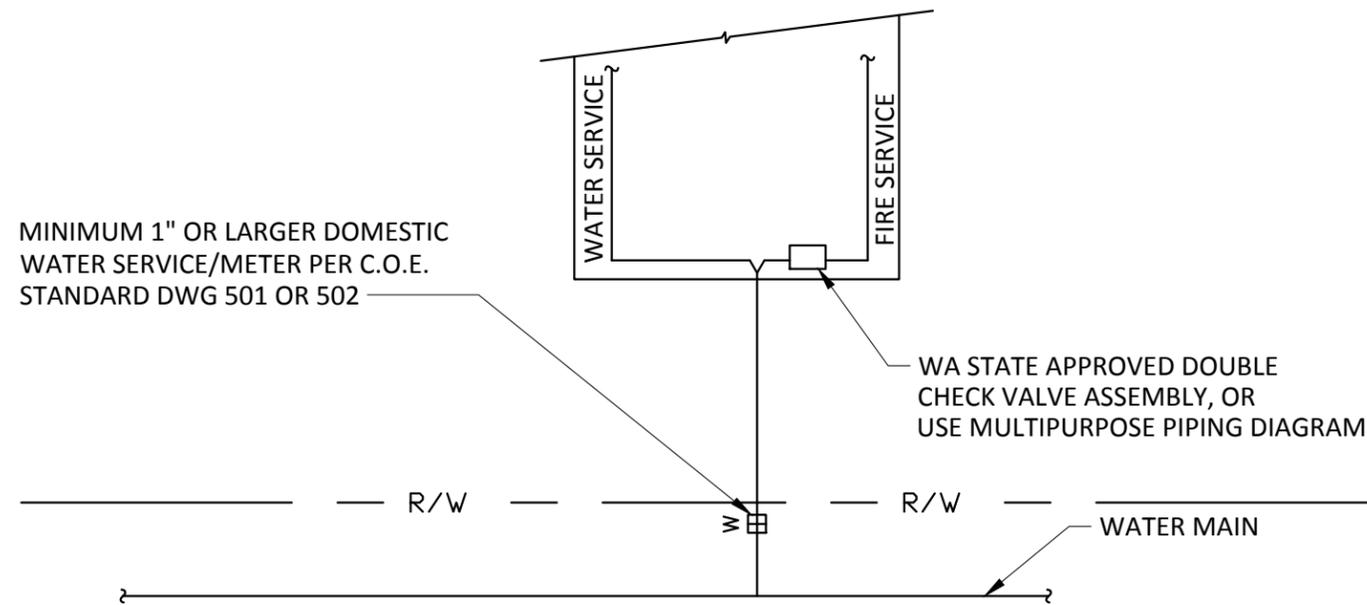

**NOTES**

- 1. TEE AND GATE VALVE REQUIRED ON MAIN.
- 2. SINGLE DETECTOR CHECKS ARE NOT APPROVED BACKFLOW PREVENTION DEVICES.
- 3. ASSEMBLY REQUIRES CERTIFICATION UPON INSTALLATION, AND RECERTIFICATION ANNUALLY BY OWNER.
- 4. ALL TEST COCKS MUST HAVE BRASS PLUGS.
- 5. MAXIMUM HEIGHT OF ASSEMBLY FROM FLOOR IS FIVE FEET UNLESS AN OSHA APPROVED PLATFORM IS PROVIDED.
- 6. ALL DIMENSIONS ARE MINIMUM CLEARANCE REQUIREMENTS.
- 7. FIRE DEPARTMENT PUMPER CONNECTION MUST BE DOWNSTREAM OF ASSEMBLY.
- 8. THE OSY VALVE CAN NOT BE USED AS A POST INDICATOR VALVE. (THESE ARE ONLY PART OF THE BACKFLOW ASSY.)

TITLE <b>DOUBLE CHECK DETECTOR VALVE ASSEMBLY</b> (DCDA) 3" & LARGER SERVICE INSIDE A BUILDING			Current Rev Date <b>12/30/2016</b> <small>STANDARD DRAWING No.</small>
			<b>523</b>

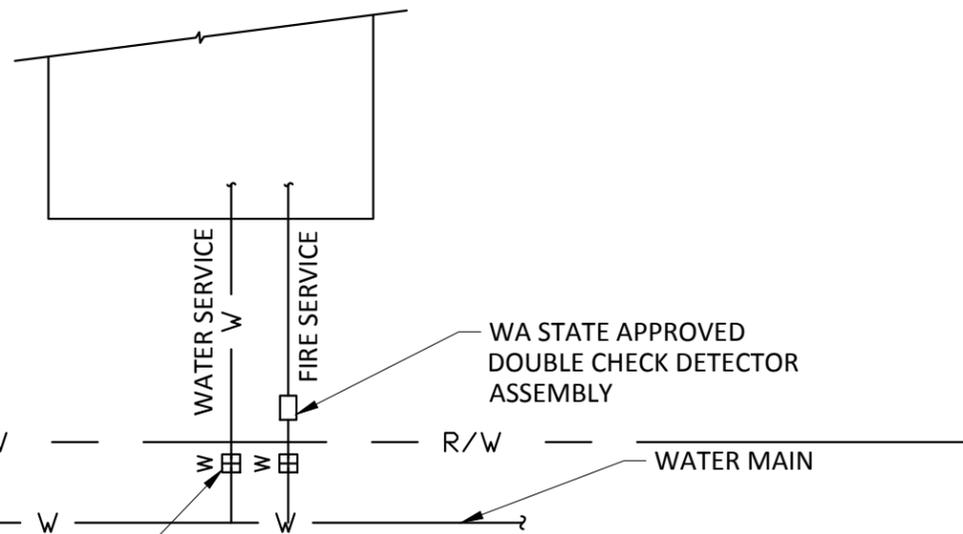

MINIMUM 1" OR LARGER DOMESTIC WATER SERVICE/METER PER C.O.E. STANDARD DWG 501 OR 502

WA STATE APPROVED DOUBLE CHECK VALVE ASSEMBLY, OR USE MULTIPURPOSE PIPING DIAGRAM

IRC DEFINED SINGLE FAMILY, DUPLEX OR TOWNHOUSE STRUCTURES THAT ARE REQUIRED TO OR OPT TO HAVE A FIRE SPRINKLER SYSTEM MAY USE A SINGLE DOMESTIC WATER METER PER COE STD DWG 502B OR 502C. THE SIZE OF THE SERVICE METER SHALL BE CALCULATED BY THE CIVIL ENGINEER OR FIRE SPRINKLER DESIGNER, WHO IS SOLELY RESPONSIBLE FOR THESE CALCULATIONS. THE FIRE SERVICE SIDE OF THE SYSTEM MUST HAVE A WA STATE APPROVED BACKFLOW PREVENTION DEVICE, OR BE INSTALLED PER STD DWG 524B. SYSTEMS INSTALLED IN THIS CONFIGURATION SHALL BE IN ACCORDANCE WITH NFPA 13D.

**1 OR 2 UNITS**

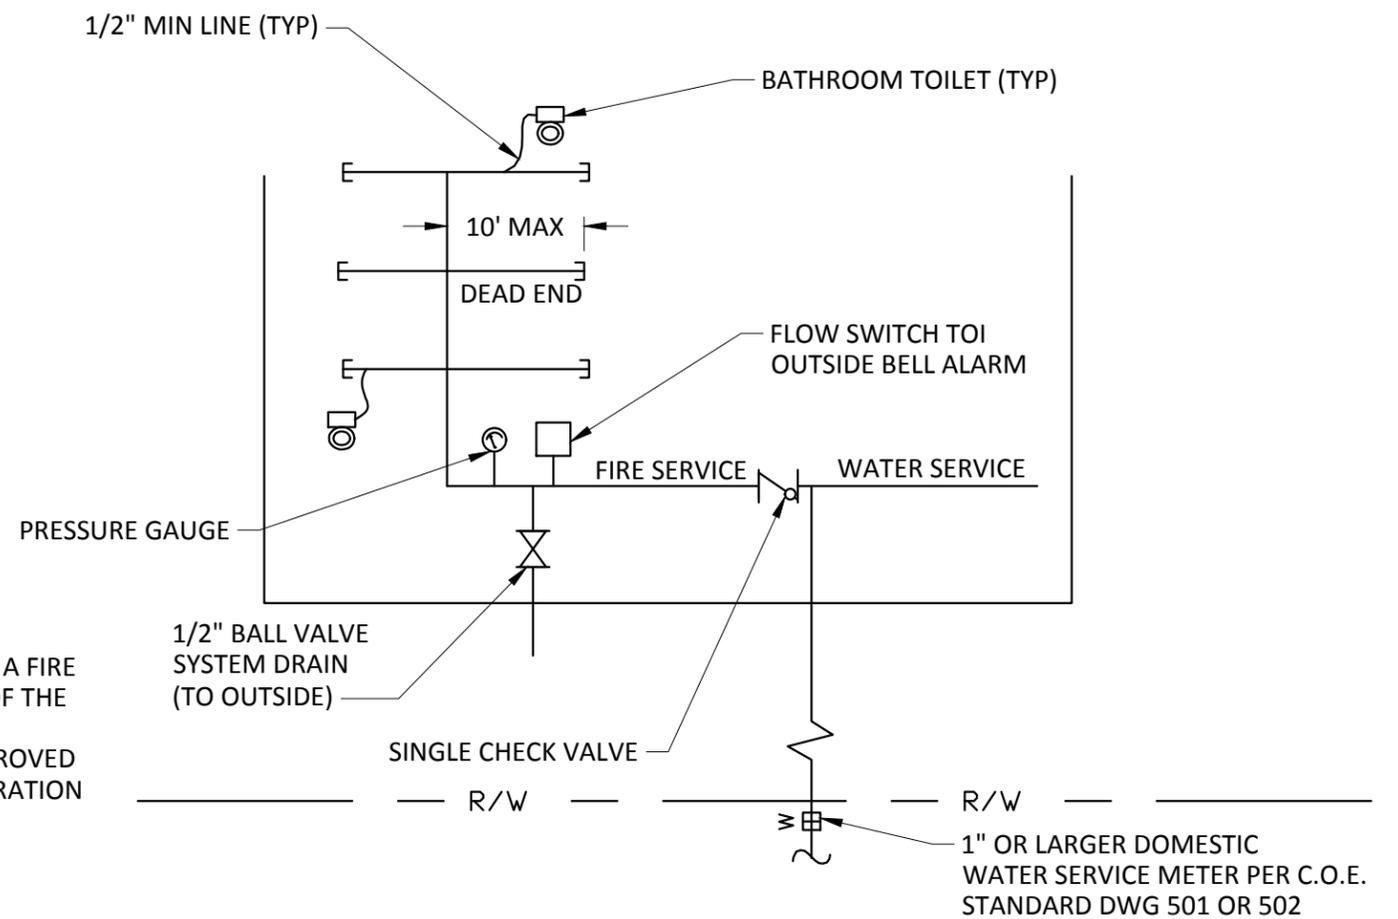

1" OR LARGER DOMESTIC WATER SERVICE/METER PER C.O.E. STANDARD DWG 501 OR 502

WA STATE APPROVED DOUBLE CHECK DETECTOR ASSEMBLY

IBC DEFINED MULTIFAMILY OR COMMERCIAL STRUCTURES THAT ARE REQUIRED TO HAVE A FIRE SPRINKLER SYSTEM MUST HAVE A SEPARATE FIRE SERVICE. THE SIZE OF FIRE SPRINKLER SERVICE AND METER SHALL BE CALCULATED BY A CIVIL ENGINEER OR FIRE SPRINKLER DESIGNER WHO IS SOLELY RESPONSIBLE FOR THIS CALCULATION. FIRE SERVICES LARGER THAN 2" MUST CONFORM TO CITY STANDARD 515 AND 523. THE FIRE SERVICE SIDE OF THE SYSTEM MUST HAVE A STATE APPROVED BACKFLOW PREVENTION DEVICE. SYSTEMS INSTALLED WITH THIS CONFIGURATION SHALL BE IN ACCORDANCE WITH NFPA 13R OR NFPA 13.

**3 UNITS OR MORE**

THIS IS A SCHEMATIC DIAGRAM OF THE MINIMUM REQUIREMENTS FOR A MULTIPURPOSE PIPING SYSTEM, PER NFPA 13D. ALL APPLICABLE CODES ARE TO BE FOLLOWED IN THE DESIGN AND INSTALLATION OF THE RESIDENTIAL PLUMBING. CONTACT THE CITY OF EVERETT FIRE MARSHAL'S OFFICE AT (425) 257-8124 OR (425) 257-8120 TO DISCUSS SPECIFIC PROJECTS.

**REQUIRED:**

- SINGLE CHECK VALVE.
- FLOW SWITCH TO OUTSIDE ALARM BELL.
- 1/2" BALL VALVE SYSTEM DRAIN (TO OUTSIDE).
- PRESSURE GAUGE.
- 1/2" MIN LINES TO MINIMUM 2 TOILETS, AT LEAST ONE TOILET PER FLOOR, FOR EFFECTIVE FLOW THROUGH SYSTEM.

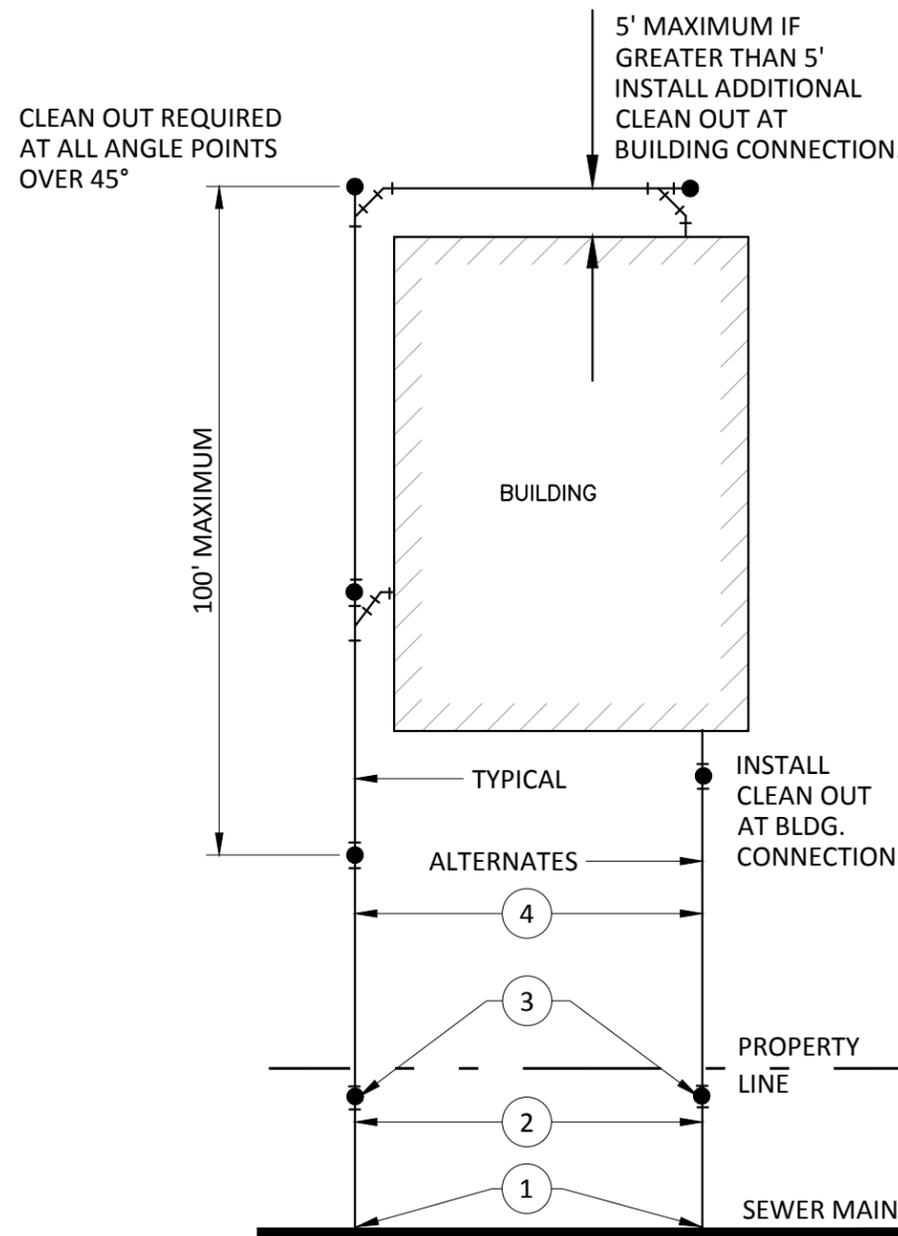

**MULTIPURPOSE PIPING SYSTEM DIAGRAM FOR 1 OR 2 UNITS**

## NOTES

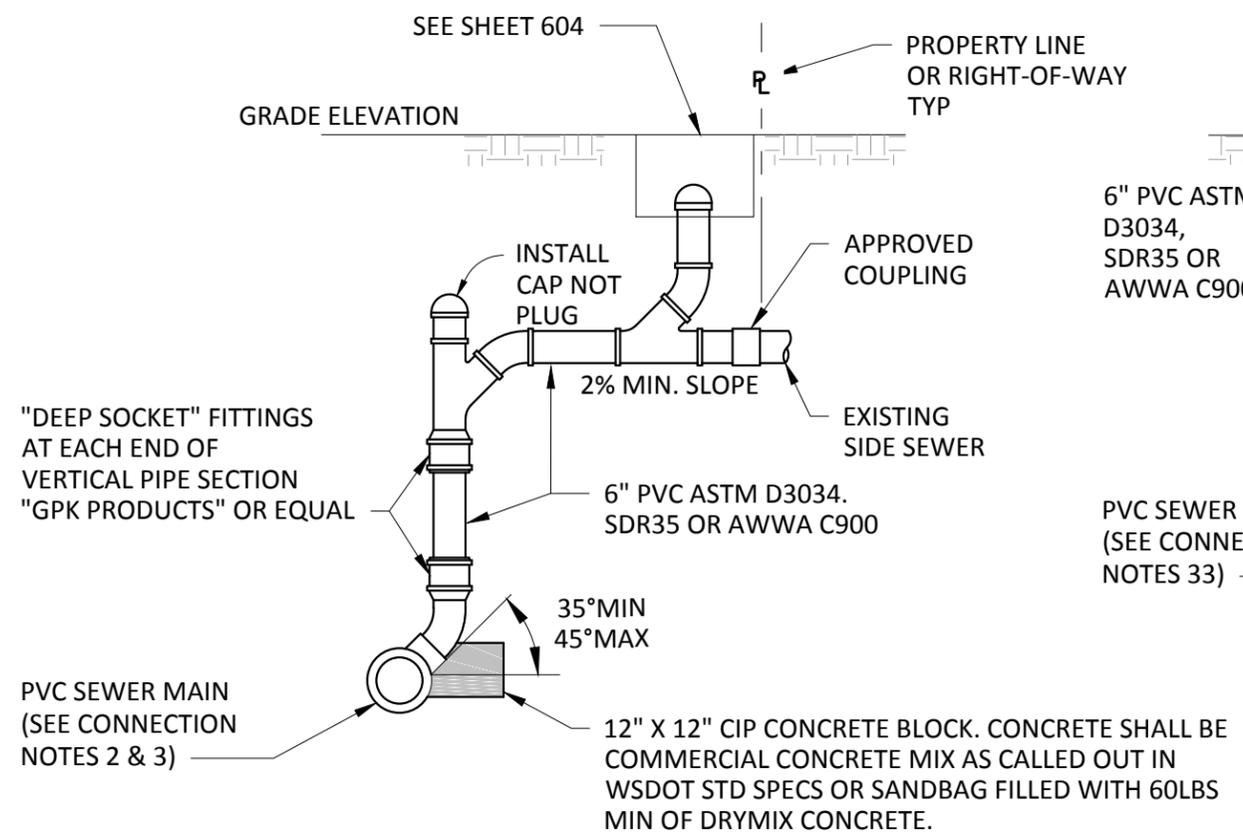

1. CONNECTION TO SEWER MAIN PER SEC. 7 OF STANDARD SPECIFICATIONS AND SPECIAL PROVISIONS AND STANDARD DRAWING 602.
2. INSTALL 6" MINIMUM PIPE SIZE IN RIGHT OF WAY.
3. INSTALL 6" CLEAN OUT PER STANDARD DRAWING 604.
4. PRIVATE SIDE SEWER PIPE DIAMETER:  
4" MINIMUM FOR SINGLE FAMILY  
6" MINIMUM FOR ALL OTHER USES.

## GENERAL NOTES

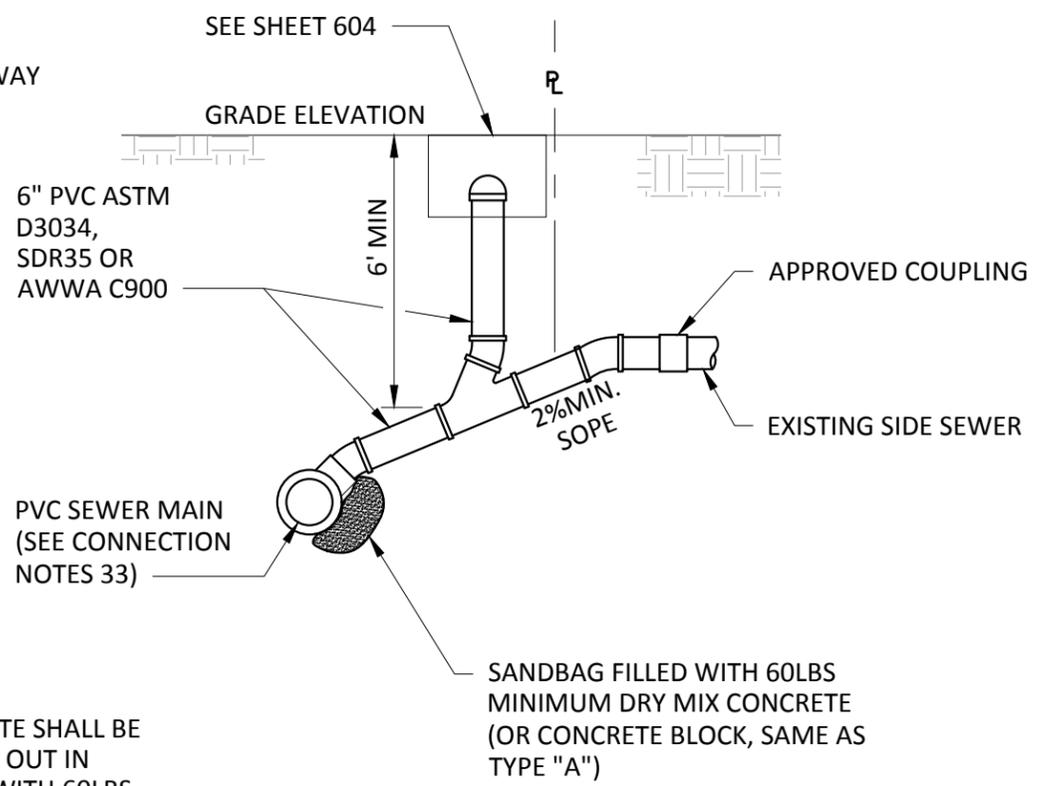

1. SEE SECTION 7 OF STANDARD SPECIFICATIONS FOR ROADS; BRIDGE AND MUNICIPAL CONSTRUCTION WSDOT/APWA AND CITY SPECIAL PROVISIONS SECTION 7-18 FOR DETAILS AND REQUIREMENTS ON LATERALS.
2. ALL CLEAN OUT'S ON PRIVATE PROPERTY ARE TO BE ADJUSTED TO GRADE IF IN PAVED AREAS PER STANDARD DRAWING 604.
3. CLEAN OUT'S ARE TO BE CONSTRUCTED WITH WYES OR SANITARY "T"'S (SWEEPS). STRAIGHT "T"'S ARE NOT PERMITTED.
4. ALLOWABLE GRADES ARE 2% (1/4"/FT) MINIMUM TO 100% (FT/FT) MAXIMUM.
5. SEWER MUST BE STRAIGHT BETWEEN ANGLE POINTS, CHANGES IN LINE OR GRADE SHALL BE MADE WITH APPROVED FITTINGS.
6. NORMALLY ONLY ONE(1) CONNECTION TO THE SEWER MAIN PER BLDG. IS ALLOWED. TWO (2) DIFFERENT LAYOUTS ARE SHOWN FOR ILLUSTRATIVE PURPOSES ONLY!

## NOTES

1. STEPS SHALL BE STEEL REINFORCED COPOLYMER POLYPROPYLENE PLASTIC CONFORMING TO:
  - (A) ASTM C 478 AND AASHTO M-199, ANCHOR-BOLTS SHALL HAVE A MINIMUM HORIZONTAL PULLOUT RATING OF 1500 LBS.
  - (B) ASTM A615 GRADE 60 (DEFORMED REINFORCING STEEL BAR).
  - (C) POLYPROPYLENE CONFORMS TO D-4101.
2. MANHOLE STEPS SHALL HAVE MOLDED SAFETY HAND GRIP. RED REFLECTORS ARE PREFERRED.
3. ALL FABRICATION DIMENSIONS INDICATED ARE MINIMUM.
4. THE ENTIRE POLYPROPYLENE PLASTIC MATERIAL SURROUNDING THE REINFORCING STEEL BAR SHALL BE CAST MONOLITHICALLY. MINIMUM COVER SHALL BE 3/16-INCH.
5. STEP RUNGS SHALL BE SPACED AT A MAXIMUM OF 14 INCHES.
6. STEPS SHALL BE INSTALLED IN ACCORDANCE WITH THE APPROVED MANUFACTURERS RECOMMENDED PROCEDURE.

ANCHOR PADS 2-3/4" X 2" WITH TWO 7/8" DIA HOLES ANCHOR USING TWO 1/2" DIA 3" STAINLESS STEEL ANCHOR BOLTS

**DRAFT**

T:\ACAD\EPS-COE DESIGN & CONSTR SPECS FOR DEVELOPMENT\IN-WORK\STD613.DWG 12/27/2016 11:55 AM

## NOTES

1. W = MAXIMUM WIDTH OF TRENCH. FOR PIPES 15" OR LESS IN DIA W=40". FOR PIPES 18" OR GREATER W=1.5 X I.D. + 18". PIPE MUST BE CENTERED IN TRENCH.
2. ALTERNATE SLOPING TRENCH WALL TO MEET O.S.H.A. REQUIREMENTS (NO SLOPES STEEPER THAN 1:1 EXCEPT FOR ROCK).
3. SUITABLE NATIVE MATERIAL OR IMPORTED GRAVEL BORROW AS DIRECTED. COMPACT TO 90% MAXIMUM DENSITY.
4. FOUNDATION GRAVEL IF REQUIRED BY THE ENGINEER TO REPLACE UNSUITABLE MATERIAL. SHALL BE FOUNDATION MATERIAL CLASS A, B OR AS APPROVED BY THE ENGINEER.
5. FOR ADDITIONAL COMPACTION INFORMATION SEE STANDARD DWG 615.
6. IF DIRECTED BY THE ENGINEER THE TOP THREE TO FIVE FEET OF BACKFILL SHALL BE IMPORTED GRAVEL BORROW OR SUITABLE NATIVE MATERIAL COMPACTED TO 95% MAXIMUM DENSITY.
7. SEE CITY OF EVERETT STANDARD DWG 316 FOR PAVEMENT PATCH DETAILS.
8. VERTICAL TRENCH WALLS WITH SHORING TO CONFORM TO O.S.H.A. REGULATIONS.
9. SUBGRADE OR GROUND SURFACE IN NON-PAVED AREAS.
10. EXCAVATED NATIVE MATERIAL OR STOCKPILED BACKFILL MATERIAL.
11. FOR ALL TRENCHING TRANSVERSE TO THE ROADWAY BACKFILL ABOVE THE PIPE ZONE SHALL BE CONTROLLED DENSITY FILL. SEE SECTION 3-9.6 & 3-20.1 OF THESE STANDARDS.
12. FOR UTILITY CUTS SUCH AS GAS, TELEPHONE, POWER, AND CABLE TV LONGITUDINAL TO THE ROADWAY, BACKFILL SHALL BE CONTROLLED DENSITY FILL. SEE SECTION 3-9.5 OF THESE STANDARDS.

TITLE			Current Rev Date 12/30/2016
TYPICAL TRENCH SECTION DUCTILE IRON PIPE			STANDARD DRAWING No. 614

## LIMITS OF TRENCH

W = MAXIMUM WIDTH OF TRENCH. FOR PIPES 15" OR LESS IN DIAMETER W = 40". FOR PIPES 18" OR GREATER W = 1 1/2 x I.D. + 18". PIPE MUST BE CENTERED IN TRENCH.

## MATERIALS

PIPE BEDDING MATERIAL SHALL BE CRUSHED SURFACING BASE COURSE CONFORMING TO SECTION 9-03.9(3) OF THE STANDARD SPECIFICATIONS FOR ROAD, BRIDGE AND MUNICIPAL CONSTRUCTION WSDOT/APWA.

OPTIONAL PIPE BEDDING (TO SPRING-LINE) FOR PIPE 15" DIA AND LARGER: PEA GRAVEL OR 3/4" CLEAN ROCK CHIPS AS APPROVED IN ADVANCE BY ENGINEER.

OVER EXCAVATION AND PLACEMENT OF FOUNDATION MATERIAL, IF REQUIRED SHALL BE FOUNDATION MATERIAL CLASS A OR B CONFORMING TO SECTION 9-03.17 OF THE STANDARD SPECIFICATIONS FOR ROAD, BRIDGE AND MUNICIPAL CONSTRUCTION WSDOT/APWA.

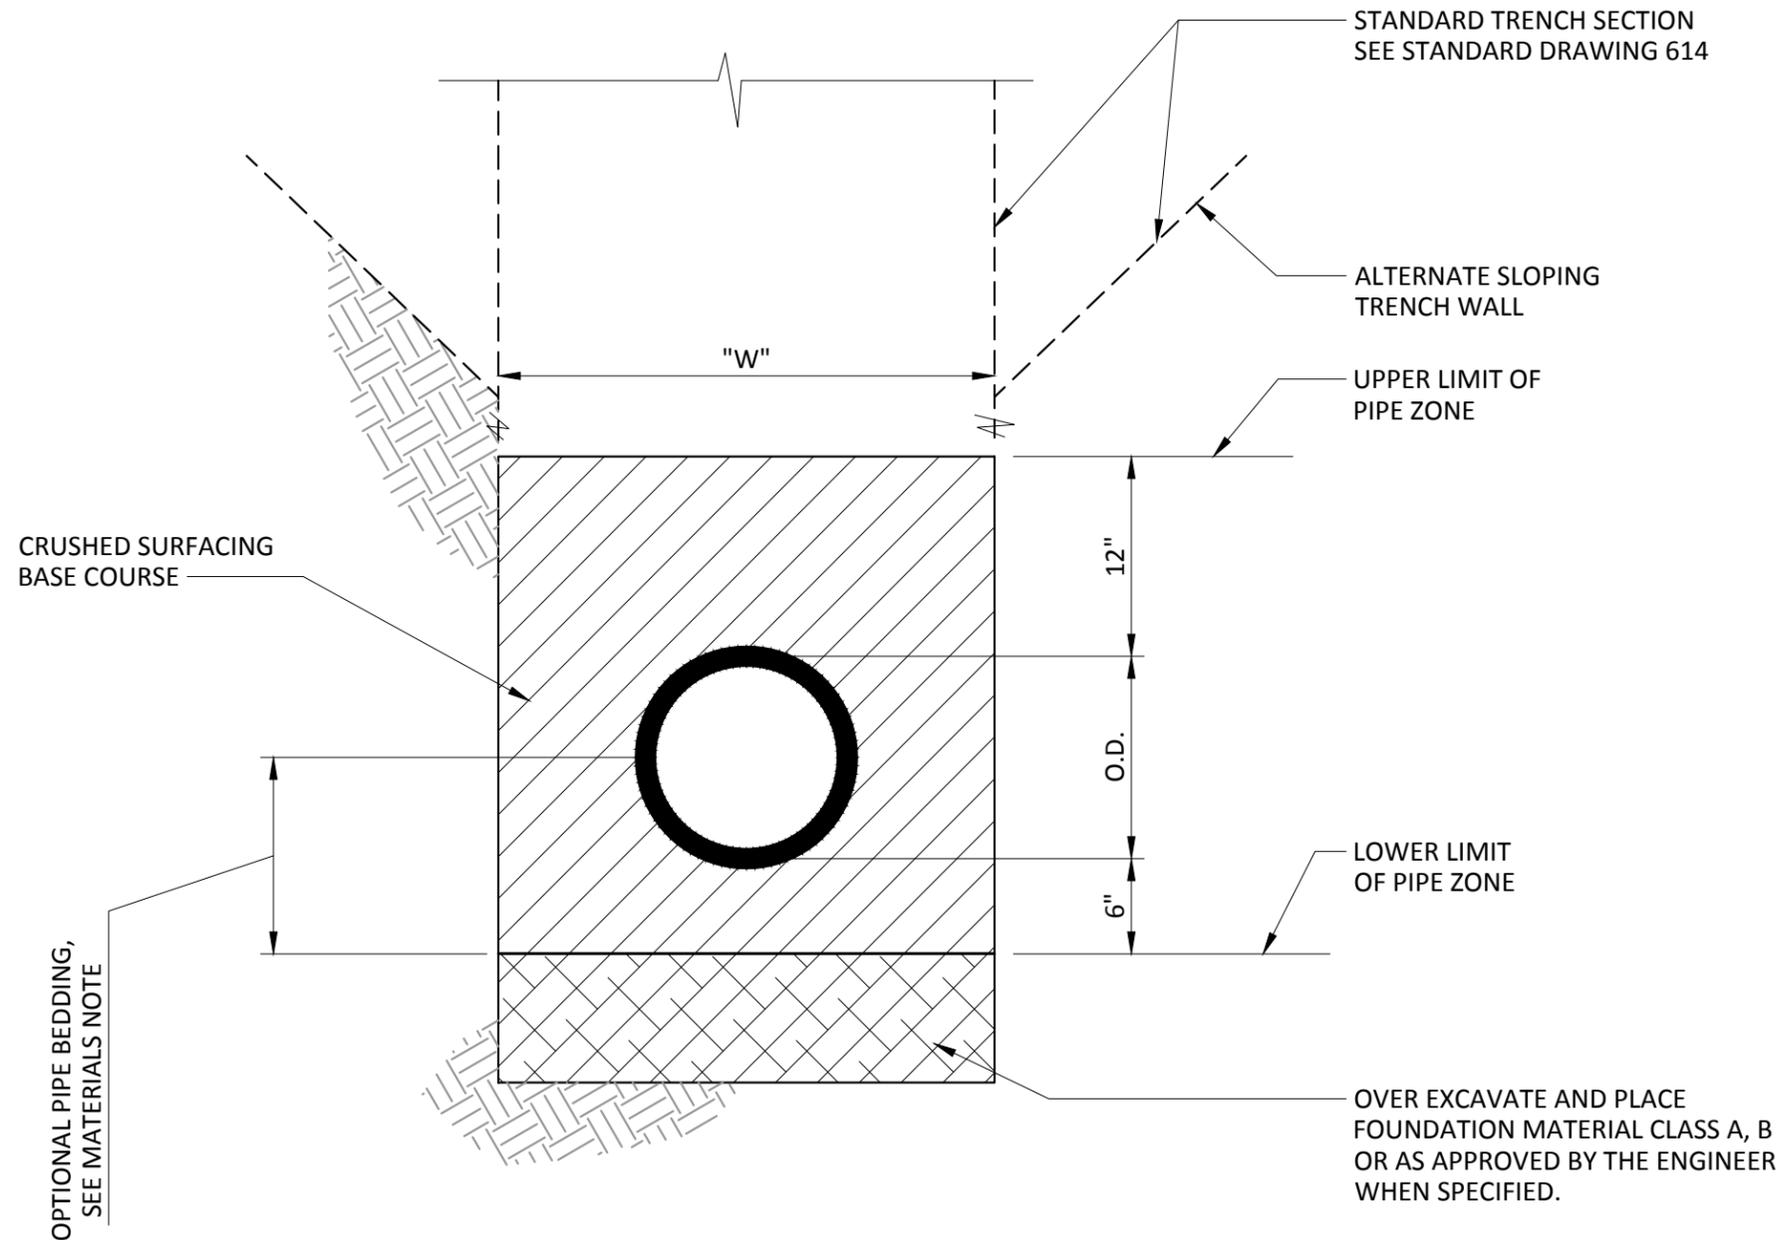

## PROCEDURE FOR COMPACTION

PROVIDE UNIFORM SUPPORT UNDER PIPE BARREL.

COMPACT BEDDING MATERIAL TO 90% MAXIMUM DENSITY EXCEPT DIRECTLY OVER PIPE, HAND TAMP ONLY.

HAND TAMP UNDER PIPE HAUNCHES FOR ALL BEDDING MATERIALS.

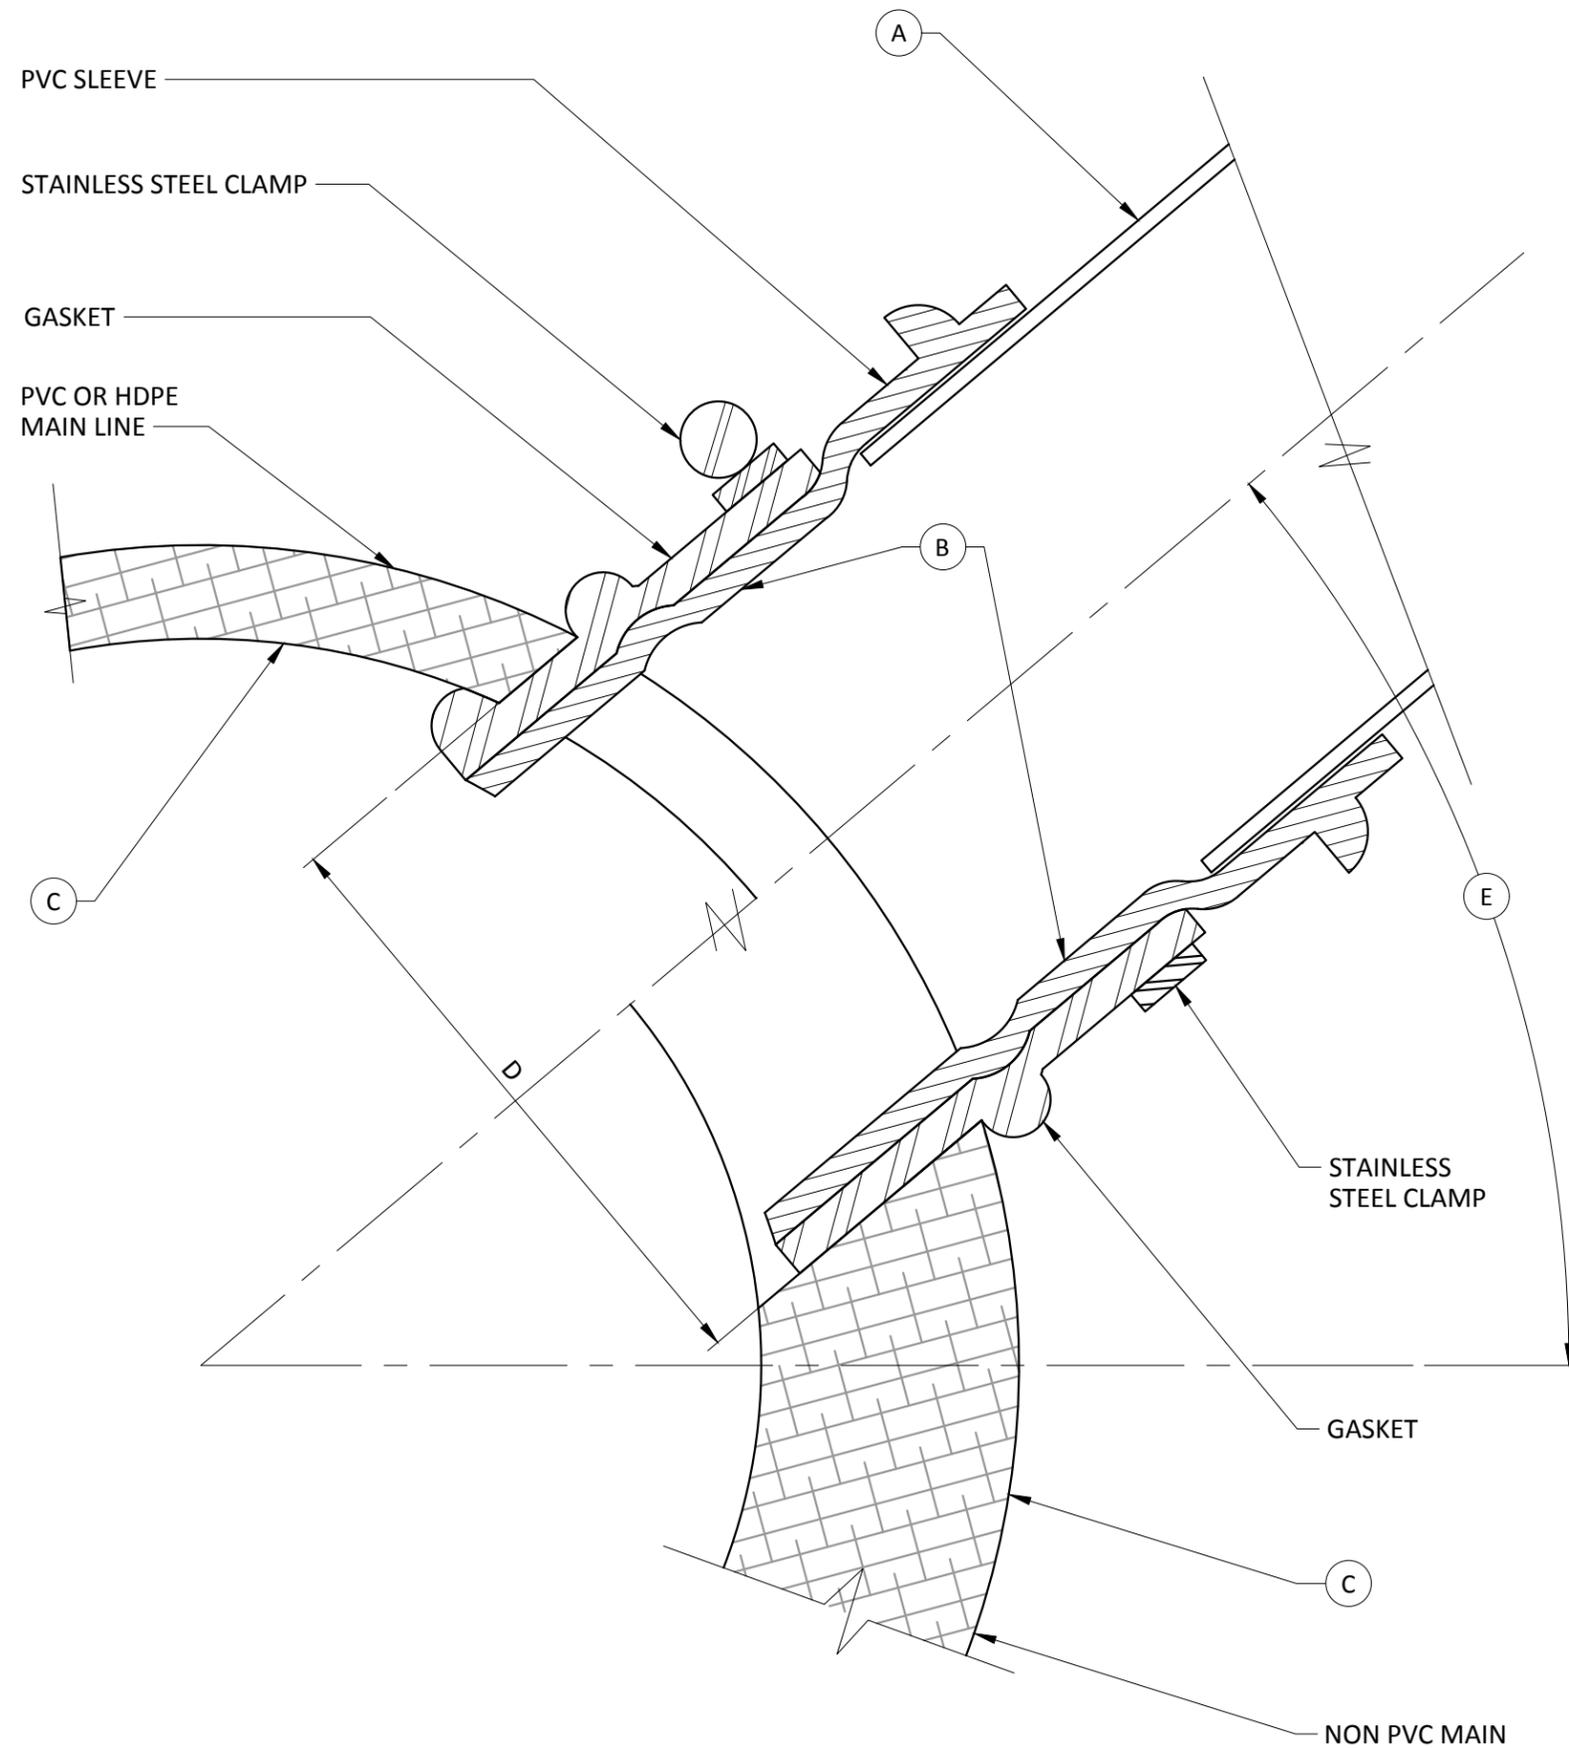

FOR ADDITIONAL COMPACTION INFORMATION SEE STANDARD DWG 615.

## BEDDING AND FOUNDATION:

TITLE <b>CASING DETAIL PRE-FABRICATED SKIDS</b>				STANDARD DRAWING No. <b>618</b>

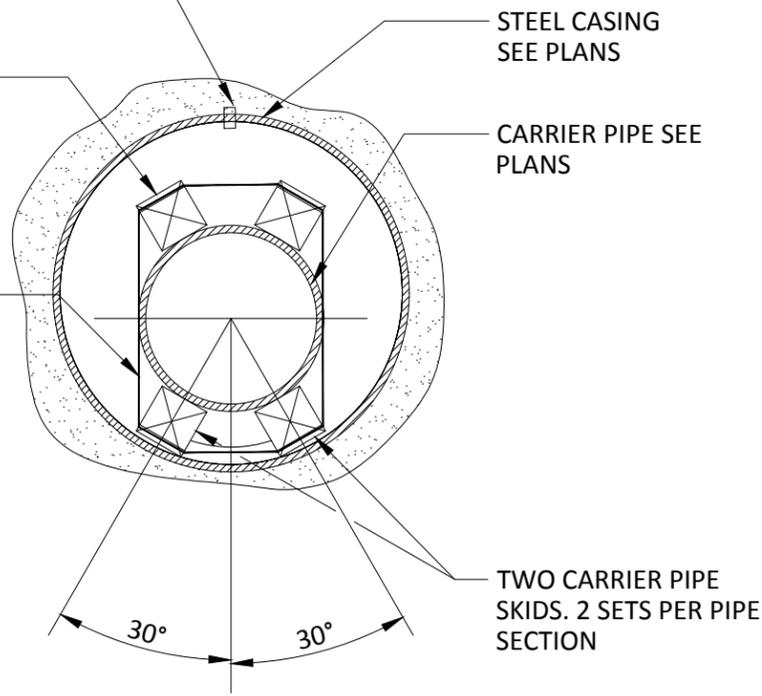

TWO OR FOUR 4"x4"x8" WOOD SUPPORT BLOCK PER SKID.  
VOIDS CREATED BY BORING SHALL BE FILLED BY PRESSURE GROUTING  
1 1/2" GROUT PORTS EVERY 10'

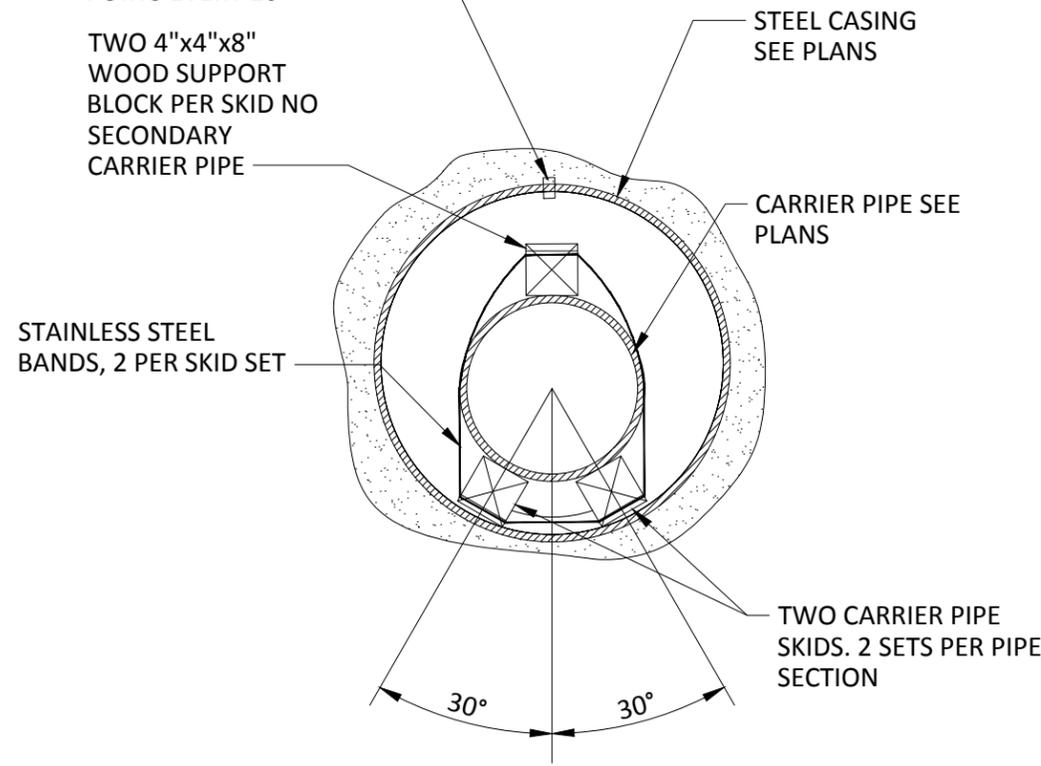

**NOTES**

1. ALL JOINTS OF CARRIER PIPE WITHIN CASING SHALL BE FLANGED (FL) OR MECHANICAL JOINT (MJ) FITTINGS WITH MEG-A-LUG RESTRAINTS.
2. CARRIER PIPE WILL BE PRESSURE TESTED BY CONTRACTOR AND TV INSPECTION BY CITY CREWS.
3. CARRIER SKIDS SHALL BE SECURELY ATTACHED TO CARRIER PIPE W/STAINLESS STEEL (SST) BANDS (MIN 2 BANDS PER SKID SET).
4. CARRIER SKIDS SHALL BE ROUNDED OR BEVELED ON LEADING EDGE, AND SHALL BE NOTCHED TO RECEIVE SST BANDS.
5. CARRIER SKIDS SHALL BE PRESSURE TREATED WOOD 4"x4"x48" (2 SETS OF 2 SKIDS PER LENGTH OF PIPE). CONTRACTOR MAY USE APPROVED PREFABRICATED SKIDS PROVIDED A 1" MIN CLEARANCE IS MAINTAINED BETWEEN JOINT FLANGE AND CASING.
6. SECONDARY CARRIER PIPES SHALL BE SECURED TO THE TOP OF THE MAIN CARRIER PIPE AS SHOWN.
7. SECONDARY CARRIER PIPE WILL BE TESTED BEFORE CASING ANNULAR SPACE IS FILLED.
8. END SEALS SHALL BE PROVIDED FOR THE JACKED CASING PIPES. THE END SEALS SHALL BE APS STANDARD MODEL AM AS MANUFACTURED BY ADVANCED PRODUCTS (WWW.APSONLINE.COM) OR APPROVED EQUIVALENT.
9. CASING, APPURTENANCES AND ALL OTHER MISCELLANEOUS ITEMS TO BE FURNISHED BY CONTRACTOR.

1 1/2" GROUT PORTS EVERY 10'  
FOUR 4"x4"x8" WOOD SUPPORT BLOCKS PER SKID  
NO SECONDARY CARRIER PIPE

1 1/2" GROUT PORTS EVERY 10'

DRAWING 611

## NOTES

1. ALL BACKFILL MATERIAL SHALL BE PLACED IN LIFTS NOT TO EXCEED 12 INCHES BEFORE COMPACTION UNLESS AUTHORIZED BY THE ENGINEER DUE TO THE CHARACTER OF THE MATERIAL AND THE COMPACTING EQUIPMENT.
2. MECHANICAL COMPACTION OF BACK FILL MATERIAL SHALL NOT BEGIN UNTIL THE DEPTH OF COMPACTED BACKFILL MATERIAL IS 2 FEET ABOVE THE TOP OF PIPE.
3. EACH LIFT SHALL BE MECHANICALLY COMPACTED TO THE REQUIRED DENSITY PRIOR TO PLACING SUBSEQUENT LIFTS OF BACKFILL MATERIAL.
4. COMPACTION TESTS SHALL BE AS REQUIRED BY THE CITY ENGINEER, BUT IN NO CASE LESS THAN 2 TESTS EVERY 200 FEET OF TRENCH (ONE AT SUBGRADE AND ONE AT 50% OF TRENCH DEPTH).
5. IN PLACE DENSITY AND MOISTURE CONTENT WILL BE DETERMINED USING NUCLEAR METHOD, ASTM 2922-71.
6. LABORATORY MAXIMUM DRY DENSITY AND OPTIMUM MOISTURE CONTENT WILL BE DETERMINED USING THE MODIFIED PROCTOR METHOD IN ACCORDANCE WITH ASTM D-1557.

TITLE <b>TRAFFIC CONTROL PLAN</b> 5 LANE ROADWAY WITH RIGHT LANE CLOSURE FAR SIDE OF INTERSECTION			Current Rev Date <b>12/30/2016</b> STANDARD DRAWING No. <b>708</b>

**DRAFT**

T:\ACAD\EPS-COE DESIGN & CONSTR SPECS FOR DEVELOPMENT\IN-WORK\STD709.DWG

**NOTES**

1. DISTANCE BETWEEN SIGNS SHALL BE 100' FOR RESIDENTIAL STREETS (25 MPH) AND 350' FOR ARTERIAL ROADWAYS
2. FLASHING BEACON INSTALLED AT EACH SIGN FOR NIGHT-TIME USE (OPTIONAL).
3. DISTANCES MAY VARY AS APPROVED BY THE ENGINEER.
4. SPOTTERS REQUIRED WHENEVER THE CONTRACTOR MUST INTERRUPT TRAFFIC FLOW TO ACCESS THE WORK SITE WITH MATERIALS OR EQUIPMENT (FLAGGING REQUIRES 3 OR 4 SIGN SETUP).
5. SIGN SIZE PER MUTCD.
6. THIS PLAN IS PROVIDED AS A GUIDE ONLY. FOR SPECIFIC INFORMATION ON TRAFFIC CONTROL PLANS SEE CURRENT MUTCD.

**LEGEND**

☉ CONE OR CHANNELIZING DEVICE SEE STD 713.

**NOTES:**

1. UNLESS OTHERWISE INDICATED ON PLANS ALL LOOP DETECTORS SHALL BE CENTERED IN THE LANE.
2. FOR LANES 14' AND WIDER, 8'x30' LOOP WILL BE USED.
3. ALL LOOP DETECTORS SHALL BE BROUGHT BACK AS INDIVIDUALLY TWISTED AND SHIELDED PAIR, THIS SHIELDED PAIR MAY BE CONTAINED IN MULTI-PAIR (INDIVIDUALLY SHIELDED AND TWISTED) CABLE.
4. INSTALL MAXIMUM OF 3 LOOPS PER SAWCUT. ONLY LOOPS ASSOCIATED WITH THE SAME SIGNAL PHASE SHALL BE INSTALLED IN THE SAME SAWCUT.
5. FOR CROSSWALK AND STOPLINE LAYOUT SEE STANDARD DRAWING 721.
6. FOR LOOP INSTALLATION SPECIFICATIONS SEE STANDARD DRAWING 806A & 806B.
7. HOME RUNS WILL CROSS ADJACENT LANES AT RIGHT ANGLE TO DIRECTION OF TRAVEL SO AS TO NOT CONFLICT WITH FUTURE LOOP INSTALLATION IN THE ADJACENT LANES.
8. 6"x6" WHITE STAMARK TAPE LOCATED AT THE CENTER OF THE LOOP, ORIENTED AS A DIAMOND IN THE LANE TO BE INSTALLED BY CITY FORCES OR STRIPING CONTRACTOR.

GENERAL NOTES FOR LOOP INST.

1. INSTALL JUNCTION BOX AND LEAD-IN CONDUIT.
2. SAW LOOP SLOTS AND LEAD-IN SLOTS.
3. LAY OUT LOOP WIRE BEGINNING AT JUNCTION BOX, ALLOWING 5' MINIMUM SLACK.
4. INSTALL WIRE IN LOOP SLOT. SEE LOOP WINDING DETAIL.
5. RETURN TO JUNCTION BOX AND IDENTIFY LEADS WITH PLAN DETECTOR NUMBER AND "S" FOR START AND "F" FOR FINISH.
6. TWIST EACH PAIR OF LEAD-IN WIRES TWO TURNS PER FOOT FROM LOOP TO JUNCTION BOX AND INSTALL IN LEAD-IN SLOT AND CONDUIT. REVERSE DIRECTION OF TWIST FOR EACH SUCCESSIVE PAIR INSTALLED.
7. CONSTRUCT SUPPLEMENTAL SPLICE CONTAINING ANY SERIES OR PARALLEL LOOP CONNECTIONS REQUIRED IN PLANS. SUPPLEMENTAL SPLICES ARE SUBJECT TO THE SAME REQUIREMENTS SHOWN FOR THE LOOP LEAD AND SHIELDED CABLE SPLICE. IF APPROVED BY ENGINEER SCOTCHLOK 3570 EPOXY KIT SEALING PACKS MAY BE SUBSTITUTED FOR THE SCOTCHCAST 82-B1 FOR SUPPLEMENTAL SPLICES.
8. SPLICE LOOP LEADS OR SUPPLEMENTAL SPLICE LEADS TO SHIELDED CABLE AS NOTED.
9. COMPLETE INSTALLATION AND TEST LOOP CIRCUITS OR COMBINATION LOOP CIRCUITS. SEE WSDOT STD SPEC 8-20.3(14)D.
10. FOR LOOP LOCATION REFER TO STD DWG 802 AND PLANS.
11. DRILL HOLE FOR HOME-RUN CONDUIT 1" LARGER THAN CONDUIT AND FILL VOID WITH HOT MIX ASPHALT.
12. ALL SPLICES SHALL BE ABLE TO BE RAISED A MINIMUM OF 16" ABOVE GROUND LINE.

**FOUNDATION SECTION**

**CONDITION 3 NOTES:**

1. IF POLE FOUNDATION FALLS WITHIN SIDEWALK AREA, TOP OF FOUNDATION WILL BE FLUSH WITH FINISHED SIDEWALK AND BE FINISHED IN THE SAME MANNER AS SIDEWALK.
2. 1/2" EXPANSION JOINT WILL BE PLACED BETWEEN FOUNDATION AND SIDEWALK.

**CONDITION 3**

**PLACEMENT NOTES:**

1. CONDITION 1 & 2 ARE NORMAL INSTALLATION OPTIONS DEPENDING ON STREET DESIGN.
2. CONDITION 3 INSTALLATION IS ALLOWED WITH APPROVAL OF CITY ENGINEER WHERE EXISTING R/W OR PHYSICAL CONDITIONS WARRANT THIS TYPE INSTALLATION.

**BASE PLATE & BOLT CIRCLE NOTES:**

1. BASE PLATE PER POLE FABRICATOR'S DRAWINGS:
2. FOR ALUMINUM POLES, BOLT CIRCLE IS 11-1/2" +/- 1/2".
3. FOR STEEL POLES, BOLT CIRCLE IS DEPENDENT ON TYPE AND HEIGHT OF POLE.

**# POLE & FOUNDATION NOTES:**

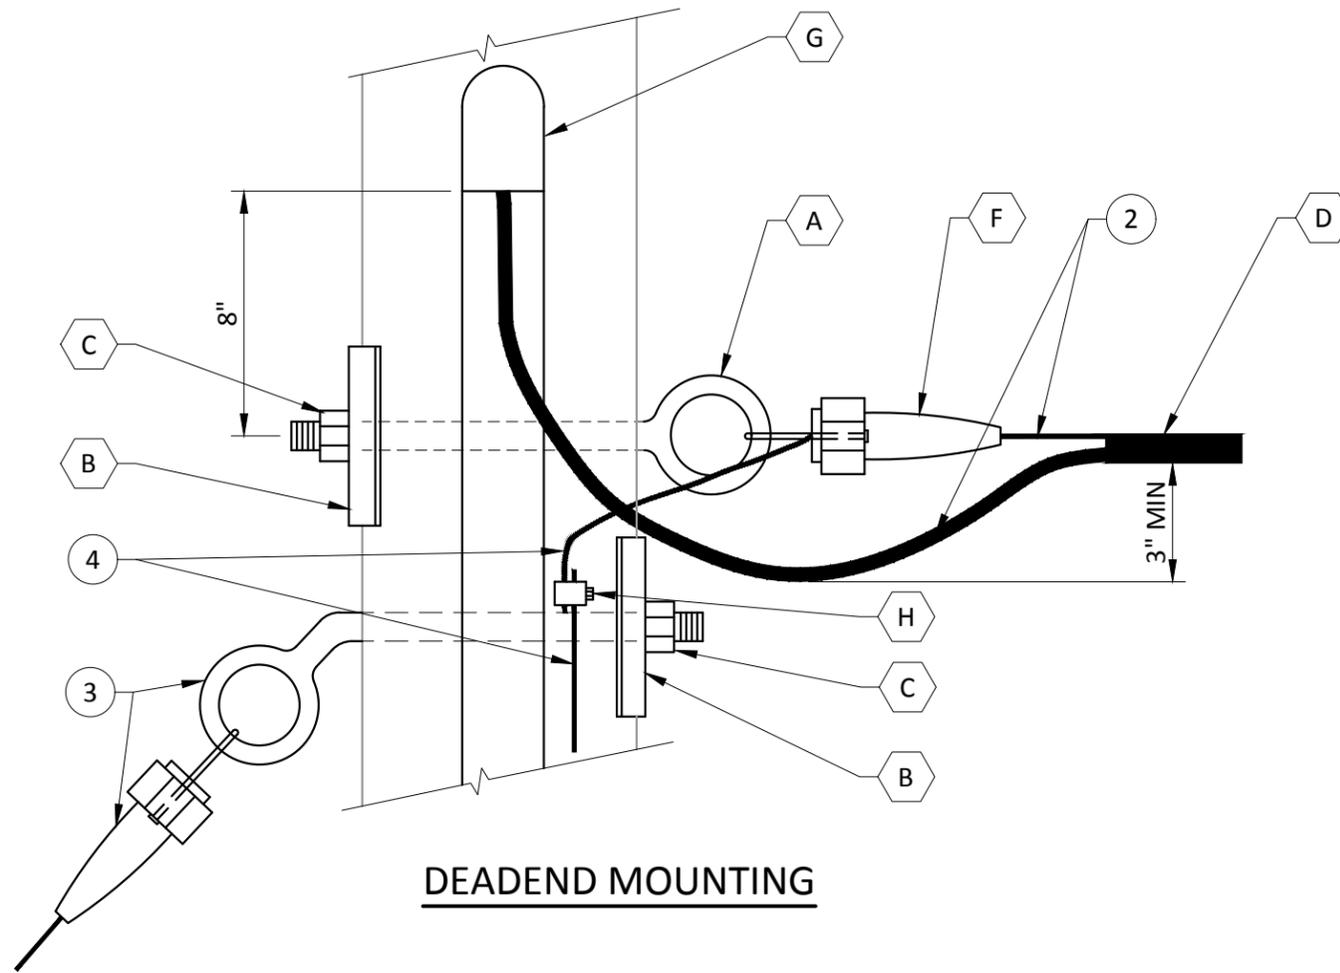

1. THE TOP 12" OF ANCHOR BOLTS SHALL BE GALVANIZED.
2. INSTALL 2" x 1" REDUCING WASHER AND 1" CONNECTOR TO SECURE CONDUCTORS, AND COIL 30" OF CABLE FOR FUTURE CONNECTION AT END OF MAST ARM.
3. FOR DOUBLE MAST ARM INSTALL 2ND CABLE BETWEEN LUMINAIRES WHEN BOTH LUMINAIRES ARE ON SAME CIRCUIT.
4. CONDUCTOR ATTACHMENT BRACKET PER WSDOT/APWA STD PLAN J-1E.
5. PLACE POLE AND BRACKET CABLE IN CONDUCTOR ATTACHMENT BRACKET. STRIP OUTER CABLE SHEATH BELOW BRACKET AND CONNECT TO FEED CABLE WITH QUICK DISCONNECTS PER WSDOT/APWA STD SPEC 9-29.7
